Type Package

Title Conventional and Fuzzy Data Envelopment Analysis

Version 1.4

Author Vicente Coll-Serrano, Vicente Bolos, Rafael Benitez Suarez <rabesua@uv.es>

Maintainer Vicente Bolos <vicente.bolos@uv.es>

Description Set of functions for Data Envelopment Analysis. It runs both classic and fuzzy DEA models. See: Banker, R.; Charnes, A.; Cooper, W.W. (1984). <doi:10.1287/mnsc.30.9.1078>, Charnes, A.; Cooper, W.W.; Rhode
2217(78)90138-
8> and Charnes, A.; Cooper, W.W.; Rhodes, E. (1981). <doi:10.1287/mnsc.27.6.668>.

R topics documented:

`Airlines` *Data: Coelli, Grifell-Tatje, and Perelman (2002).*

Description

Data of 28 airlines with 2 outputs and 4 inputs.

Usage

```
data("Airlines")
```

Format

Data frame with 28 rows and 7 columns. Definition of outputs (Y) and inputs (X):

y1 = Pass Passenger-kilometers flown

y2 = Cargo Freight tonne-kilometers flown

x1 = Lab Labor (number of employees)

x2 = Fuel Fuel (millions of gallons)

x3 = Matl Other inputs (millions of U.S. dollar equivalent) consisting of operating and maintenance expenses excluding labor and fuel expenses

x4 = Cap Capital (sum of the maximum takeoff weights of all aircraft flown multiplied by the number of days flown)

bootstrap_basic *Bootstrapping DEA*

Description

To bootstrap efficiency scores, deaR uses the algorithm proposed by Simar and Wilson (1998). For now, the function bootstrap_basic can only be used with basic DEA models.

Usage

```
bootstrap_basic(datadea,
                orientation = c("io", "oo"),
                rts = c("crs", "vrs", "nirs", "ndrs", "grs"),
                L = 1,
                U = 1,
                B = 2000,
                h = NULL,
                alpha = 0.05)
```

Arguments

datadea	A deadata object with n DMUs, m inputs and s outputs.
orientation	A string, equal to "io" (input oriented) or "oo" (output oriented).
rts	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing), "ndrs" (non-decreasing) or "grs" (generalized).
L	Lower bound for the generalized returns to scale (grs).
U	Upper bound for the generalized returns to scale (grs).
B	Number of bootstrap iterations.
h	Bandwidth of smoothing window. By default h = 0.014 (you can set h equal to any other value). The optimal bandwidth factor can also be calculated following the proposals of Silverman (1986) and Daraio y Simar (2007). So, h = "h1" is the optimal h referred as "robust normal-reference rule" (Daraio and Simar, 2007 p.60), h = "h2" is the value of h1 but instead of the factor 1.06 with the factor 0.9, h = "h3" is the value of h1 adjusted for scale and sample size (Daraio and Simar, 2007 p.61), and h = "h4" is the bandwidth provided by a Gaussian kernel density estimate.
alpha	Between 0 and 1 (for confidence intervals).

result$CI
```

Coelli_1998 *Data: Coelli, Rao and Battese (1998).*

Description

Data of five DMUs with two inputs and one output. Prices for inputs are available. Price for output is not from Coelli et al. (1998).

Usage

```
data("Coelli_1998")
```

Format

Data frame with 6 rows and 5 columns. Definition of inputs (X) and outputs (Y):

Input1 Input 1

Input2 Input 2

Output Output

Price_input1 Price input 1

Price_input2 Price input 2

Price_output Price output

```

---

cross_efficiency *Cross efficiency analysis*

Description

Computes arbitrary, benevolent and aggressive formulations of cross-efficiency under any returns-to-scale. Doyle and Green (1994) present three alternatives ways of formulating the secondary goal (wich will minimize or maximize the other DMUs' cross-efficiencies in some way). Methods II and III are implemented in deaR with any returns-to-scale. The maverick index is also calculated.

Usage

```
cross_efficiency(datadea,
                 dmu_eval = NULL,
                 dmu_ref = NULL,
                 epsilon = 0,
                 orientation = c("io", "oo"),
                 rts = c("crs", "vrs", "nirs", "ndrs", "grs"),
                 L = 1,
                 U = 1,
                 selfapp = TRUE,
                 correction = FALSE,
                 M2 = TRUE,
                 M3 = TRUE)
```

Arguments

datadea	An object of class dea or deadata. If it is of class dea it must have been obtained with some of the multiplier DEA models.
dmu_eval	A numeric vector. Only the multipliers of DMUs in dmu_eval are computed. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
epsilon	Numeric, multipliers must be >= epsilon.
orientation	A string, equal to "io" (input-oriented) or "oo" (output-oriented).
rts	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing), "ndrs" (non-decreasing) or "grs" (generalized).
L	Lower bound for the generalized returns to scale (grs).
U	Upper bound for the generalized returns to scale (grs).
selfapp	Logical. If it is TRUE, self-appraisal is included in the average scores of A and e.
correction	Logical. If it is TRUE, a correction is applied in the "vrs" input-oriented model in order to avoid negative cross-efficiencies, according to Lim & Zhu (2015).
M2	Logical. If it is TRUE, it computes Method II for aggresive/benevolent estimations.
M3	Logical. If it is TRUE, it computes Method III for aggresive/benevolent estimations.

Note

(1) We can obtain negative cross-efficiency in the input-oriented DEA model under no constant returns-to-scale. However, the same does not happen in the case of the output-oriented VRS DEA model. For this reason, the proposal of Lim and Zhu (2015) is implemented in deaR to calculate the input-oriented cross-efficiency model under no constant returns-to-scale.

(2) The multiplier model can have alternate optimal solutions (see note 1 in model_multiplier). So, depending on the optimal weights selected we can obtain different cross-efficiency scores.

`cross_efficiency_fuzzy`

Cross efficiency fuzzy analysis

Description

Computes the cross-efficiency fuzzy tables from DEA fuzzy data or a Guo-Tanaka DEA model solution. The (crisp) relative efficiencies for the case `h = 1` are obtained from the CCR model (`model_multiplier`).

Usage

```
cross_efficiency_fuzzy(datadea,
                       orientation = c("io", "oo"),
                       h = 1,
                       selfapp = TRUE)
```

Arguments

datadea	An object of class dea_fuzzy or deadata_fuzzy. If it is of class dea_fuzzy it must have been obtained with modelfuzzy_guotanaka.
orientation	A string, equal to "io" (input-oriented) or "oo" (output-oriented).
h	A numeric vector with the h-levels (in [0,1]).
selfapp	Logical. If it is TRUE, self-appraisal is included in the average scores of A and e.

Economy *Data: Wang and Lan (2011).*

Description

Data of the industrial economy of China in 2005-2009 (data in wide format).

Usage

```
data("Economy")
```

Format

Data frame with 31 rows and 16 columns. Definition of inputs (X) and outputs (Y):

x1 = Capital Total assets (in 100 million RMB)

x2 = Labor Annual average employed persons (in 10000 persons)

y1 = GIOV Gross industrial output value (in 100 million RMB)

---

efficiencies *Objective scores*

Description

Extract the scores (optimal objective values) of the evaluated DMUs from a conventional, fuzzy or stochastic DEA solution. Note that these scores may not always be interpreted as efficiencies.

Usage

```
efficiencies(x, ...)
```

Arguments

x	An object of class dea, dea_fuzzy or dea_stoch.
...	ignored.

`efficiencies.dea` *Objective scores*

Description

Extract the scores (optimal objective values) of the evaluated DMUs from a conventional DEA solution. Note that these scores may not always be interpreted as efficiencies.

Usage

```
## S3 method for class 'dea'
efficiencies(x, ...)
```

Arguments

`x`	Object of class `dea` obtained with some of the conventional DEA `model_*` functions.
`...`	Other options (for compatibility reasons).

```

`efficiencies.dea_fuzzy` *Efficiencies*

Description

Extract the scores (optimal objective values) of the evaluated DMUs from a fuzzy DEA solution. Note that these scores may not always be interpreted as efficiencies.

Usage

```
## S3 method for class 'dea_fuzzy'
efficiencies(x, ...)
```

Arguments

`x`	Object of class `dea_fuzzy` obtained with some of the fuzzy DEA `modelfuzzy_*` functions.
`...`	Other options (for compatibility).

```
                              rts = "vrs")
efficiencies(result)
```

`eff_dmus` *Efficient DMUs.*

Description

Returns the efficient DMUs evaluated in a `dea` class object.

Usage

```
eff_dmus(deasol, tol = 1e-04)
```

Arguments

`deasol`	An object of class `"dea"` obtained by a DEA model function.
`tol`	Numeric. Absolute tolerance for numeric comparisons in efficiency scores. By default, it is 1e-4.

Value

A numeric vector containing which DMUs has been evaluated as efficient. This vector is empty if there is not any efficient DMU.

Note

If `maxslack` is `FALSE`, the slacks computed in the first stage are supposed to be the max slacks.

ccrFortune <- model_basic(dataFortune)
eff_dmus(ccrFortune)
```

`Electric_plants` *Data: Färe, Grosskopf and Kokkelenberg (1989).*

Description

Data of 19 coal-fired steam-electric generating plants operating in Illinois in 1978. Each plant uses 3 inputs to produce 1 output.

Usage

```
data("Electric_plants")
```

Format

Data frame with 18 rows and 5 columns. Definition of inputs (X) and outputs (Y):

x1 = Labor Labor average annual employment

x2 = Fuel Fuel 10^{10} Btu

x3 = Capital Capital MW (fixed input)

y1 = Output Output 10^6 Kwh

efficiencies(result)
```

`extreme_efficient` *Extreme efficient DMUs*

Description

Find a set of extreme efficient DMUs from a `deadata` object.

Usage

```
extreme_efficient(datadea,
             dmu_ref = NULL,
             rts = c("crs", "vrs", "nirs", "ndrs"),
             tol = 1e-6)
```

Arguments

`datadea`	A `deadata` object with `n` DMUs, `m` inputs and `s` outputs.
`dmu_ref`	A numeric vector containing which DMUs are the evaluation reference set, i.e. the cluster of DMUs from which we want to find a extreme efficient DMUs subset. If `NULL` (default), all DMUs are considered.
`rts`	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing) or "ndrs" (non-decreasing).
`tol`	Numeric, a tolerance margin for checking efficiency. It is 1e-6 by default.

Value

A numeric vector representing a extreme efficient subset of DMUs.

Hotels *Data: Wu, Tsai and Zhou (2011).*

Description

This dataset consists of 23 four- and five-plum ITHs in Taipei in 2006. Authors consider 4 inputs and 3 outputs.

Usage

```
data("Hotels")
```

Format

Data frame with 23 rows and 8 columns. Definition of inputs (X) and outputs (Y):

x1 = Employees Total number of employees)

x2 = Guest_rooms Total number of guest rooms)

x3 = Area_F&B Total area of F&B departments (in 36 square-feet)

x4 = Operating_cost Total operating cost (in NT$)

y1 = Room_revenue Room revenues (in NT$)

y2 = F&B_revenue F&B revenues (in NT$)

y3 = Other_revenue Other revenues (in NT$)

`is.dea` *dea class check.*

Description

Checks whether an R object is of dea class or not.

Usage

```
is.dea(x)
```

Arguments

`x`	Any **R** object.

Value

Returns `TRUE` if its argument is a dea object (that is, has "dea" amongst its classes) and `FALSE` otherwise.

Author(s)

Vicente Coll-Serrano (<vicente.coll@uv.es>). *Quantitative Methods for Measuring Culture (MC2). Applied Economics.*

is.deadata *deadata class check.*

Description

Checks whether an R object is of deadata class or not.

Usage

```
is.deadata(x)
```

Arguments

x	Any **R** object.

Value

Returns TRUE if its argument is a deadata object (that is, has "deadata" amongst its classes) and FALSE otherwise.

Author(s)

Vicente Coll-Serrano (<vicente.coll@uv.es>). *Quantitative Methods for Measuring Culture (MC2). Applied Economics.*

is.deadata_fuzzy *deadata_fuzzy class check.*

Description

Checks whether an R object is of deadata_fuzzy class or not.

Usage

```
is.deadata_fuzzy(x)
```

Arguments

x	Any **R** object.

Value

Returns TRUE if its argument is a deadata_fuzzy object (that is, has "deadata_fuzzy" amongst its classes) and FALSE otherwise.

Author(s)

Vicente Coll-Serrano (<vicente.coll@uv.es>). *Quantitative Methods for Measuring Culture (MC2). Applied Economics.*

`is.friends` *Friends check.*

Description

Checks whether a subset of DMUs is friends or not, according to Tone (2010).

Usage

```
is.friends(datadea,
             dmu_eval = NULL,
             dmu_ref = NULL,
             rts = c("crs", "vrs", "nirs", "ndrs"),
             tol = 1e-6)
```

Arguments

`datadea`	The data, including `n` DMUs, `m` inputs and `s` outputs.
`dmu_eval`	A numeric vector containing the subset of DMUs to be checked. If `NULL` (default), all DMUs are considered.
`dmu_ref`	A numeric vector containing which DMUs are the evaluation reference set. If `NULL` (default), all DMUs are considered.
`rts`	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing) or "ndrs" (non-decreasing).
`tol`	Numeric, a tolerance margin for checking efficiency. It is 1e-6 by default.

Value

Returns `TRUE` if `dmu_eval` is friends of `dmu_ref`, and `FALSE` otherwise.

```

Kao_Liu_2003 *Data: Kao and Liu (2003).*

Description

Data of 24 university libraries in Taiwan with one input and five outputs.

Usage

```
data("Kao_Liu_2003")
```

Format

Data frame with 24 rows and 11 columns. Definition of fuzzy inputs (X) and fuzzy outputs (Y):

x1 = Patronage It is a weighted sum of the standardized scores of faculty, graduate students, undergraduate students, and extension students in the range of 0 and 1.

y1 = Collections Books, serials, microforms, audiovisual works, and database.

y2 = Personnel Classified staff, unclassified staff, and student assistants.

y3 = Expenditures Capital expenditure, operating expenditure, and special expenditure.

y4 = Buildings Area and seats

y5 = Services Operating hours, attendance, circulation, communication channels, range of services, amount of services, etc.

beta3_l lower spread vector Expenditures

beta3_u upper spread vector Expenditures

beta5_l lower spread vector Services

beta5_u upper spread vector Services

Note

There are three observations that are missing: expenditures of Library 24 and services of Library 22 and Library 23. Kao and Liu (2000b) represent the expenditures of Library 24 by the triangular fuzzy number Y = (0.11; 0.41; 1.0). The services of Library 22 and Library 23 are expressed by a same triangular fuzzy number Y = (0.41; 0.69; 1.0).

make_deadata *make_deadata*

Description

This function creates, from a data frame, a deadata structure, which is as list with fields input, output, dmunames, nc_inputs, nc_outputs, nd_inputs, nd_outputs.

Usage

```
make_deadata(datadea = NULL,
          ni = NULL,
          no = NULL,
          dmus = 1,
          inputs = NULL,
          outputs = NULL,
          nc_inputs = NULL,
          nc_outputs = NULL,
          nd_inputs = NULL,
          nd_outputs = NULL,
          ud_inputs = NULL,
          ud_outputs = NULL)
```

Arguments

datadea	Data frame with DEA data.
ni	Number of inputs, if inputs are in columns 2:(ni + 1) (if DMUs are in the first column) or 1:ni (no DMUs column).
no	Number of outputs, if outputs are in columns (ni + 2):(ni + no + 1) (if DMUs are in the first column) or (ni + 1):(ni + no) (no DMUs column). If not specified, DMUs are in the first column.
dmus	Column (number or name) of DMUs (optional). By default, it is the first column. If there is not any DMU column, then it must be NULL.
inputs	Columns (numbers or names) of inputs (optional). It prevails over ni. Alternatively to datadea, it can be a matrix with the inputs (DMUs in columns). In this case, DMUs names are taken from the columns names.
outputs	Columns (numbers or names) of outputs (optional). It prevails over no. Alternatively to datadea, it can be a matrix with the outputs (DMUs in columns).
nc_inputs	A numeric vector containing the indices of non-controllable inputs.
nc_outputs	A numeric vector containing the indices of non-controllable outputs.
nd_inputs	A numeric vector containing the indices of non-discretionary inputs.
nd_outputs	A numeric vector containing the indices of non-discretionary outputs.
ud_inputs	A numeric vector containing the indices of undesirable (good) inputs.
ud_outputs	A numeric vector containing the indices of undesirable (bad) outputs.

Value

An object of class deadata

                             nd_inputs = 2,
                             ud_outputs = 2)
```

`make_deadata_fuzzy` *make_deadata_fuzzy*

Description

This function creates, from a data frame, a `deadata_fuzzy` structure, which is as list with fields `input`, `output` and `dmunames`. At the same time, `input` and `output` are lists with fields `mL`, `mR`, `dL` and `dR`.

" alt" alt

Usage

```
make_deadata_fuzzy(datadea,
                   dmus = 1,
                   inputs.mL = NULL,
                   inputs.mR = NULL,
                   inputs.dL = NULL,
                   inputs.dR = NULL,
                   outputs.mL = NULL,
                   outputs.mR = NULL,
```

```
outputs.dL = NULL,
outputs.dR = NULL,
nc_inputs = NULL,
nc_outputs = NULL,
nd_inputs = NULL,
nd_outputs = NULL,
ud_inputs = NULL,
ud_outputs = NULL)
```

Arguments

datadea	Data frame with DEA data.
dmus	Column (number or name) of DMUs (optional). By default, it is the first column. If there is not any DMU column, then it must be NULL.
inputs.mL	Where are (columns) the mL (left centers) of trapezoidal fuzzy inputs in datadea. If an input is triangular or crisp, we put the column where the centers or the crisp values are, respectively. Alternatively to datadea, inputs.mL can be a matrix of size (number of inputs x number of DMUs) with the mL of trapezoidal fuzzy inputs, the centers of triangular inputs, and the crisp values of crisp inputs. In this case, DMUs names are taken from the columns names.
inputs.mR	Where are (columns) the mR (right centers) of trapezoidal fuzzy inputs in datadea. If an input is triangular or crisp, we put NA. Alternatively to datadea, inputs.mR can be a matrix of size (number of inputs x number of DMUs) with the mR of trapezoidal fuzzy inputs, the centers of triangular inputs, and the crisp values of crisp inputs. If all inputs are triangular or crisp, then inputs.mR must be NULL (default) or equal to inputs.mL.
inputs.dL	Where are (columns) the dL (left radii) of trapezoidal and triangular fuzzy inputs in datadea. If an input is symmetric, we put the column where the radii are. If an input is rectangular or crisp, we put NA. Alternatively to datadea, inputs.dL can be a matrix of size (number of inputs x number of DMUs) with the dL of trapezoidal and triangular fuzzy inputs. If an input is rectangular or crisp, its radius is zero. If all inputs are rectangular or crisp, then inputs.dL must be NULL (default) or a zero matrix.
inputs.dR	Where are (columns) the dR (right radii) of trapezoidal and triangular fuzzy inputs in datadea. If an input is symmetric, rectangular or crisp, we put NA. Alternatively to datadea, inputs.dR can be a matrix of size (number of inputs x number of DMUs) with the dR of trapezoidal and triangular fuzzy inputs. If an input is rectangular or crisp, its radius is zero. If all inputs are symmetric, rectangular or crisp, then inputs.dR must be NULL (default) or equal to inputs.dL.
outputs.mL	Analogous to inputs.mL, but relating to outputs.
outputs.mR	Analogous to inputs.mR, but relating to outputs.
outputs.dL	Analogous to inputs.dL, but relating to outputs.
outputs.dR	Analogous to inputs.dR, but relating to outputs.

nc_inputs	A numeric vector containing the indices of non-controllable inputs.
nc_outputs	A numeric vector containing the indices of non-controllable outputs.
nd_inputs	A numeric vector containing the indices of non-discretionary inputs.
nd_outputs	A numeric vector containing the indices of non-discretionary outputs.
ud_inputs	A numeric vector containing the indices of undesirable (good) inputs.
ud_outputs	A numeric vector containing the indices of undesirable (bad) outputs.

Value

An object of class deadata_fuzzy.

Examples

```
# Example 1. If inputs and/or outputs are symmetric triangular fuzzy numbers
data("Leon2003")
data_example <- make_deadata_fuzzy(datadea = Leon2003,
                                   inputs.mL = 2,
                                   inputs.dL = 3,
                                   outputs.mL = 4,
                                   outputs.dL = 5)
# Example 2. If inputs and/or outputs are non-symmetric triangular fuzzy numbers
data("Kao_Liu_2003")
data_example <- make_deadata_fuzzy(Kao_Liu_2003,
                                   inputs.mL = 2,
                                   outputs.mL = 3:7,
                                   outputs.dL = c(NA, NA, 8, NA, 10),
                                   outputs.dR = c(NA, NA, 9, NA, 11))
```

---

make_malmquist *make_malmquist*

Description

This function creates, from a data frame, a list of deadata objects.

Usage

```
make_malmquist(datadea,
               nper = NULL,
               percol = NULL,
               arrangement  = c("horizontal", "vertical"),
               ...)
```

Arguments

datadea	Data frame with DEA data.
nper	Number of time periods (with dataset in wide format).
percol	Column of time period (with dataset in long format).
arrangement	Horizontal with data in wide format. Vertical with data in long format.
...	Other options to be passed to the make_deadata function.

Value

An object of class deadata

Examples

```
# Example 1. If you have a dataset in wide format.
data("Economy")
data_example <- make_malmquist(datadea = Economy,
                               nper = 5,
                               arrangement = "horizontal",
                               ni = 2,
                               no = 1)
# This is the same as:
data_example <- make_malmquist(datadea = Economy,
                               nper = 5,
                               arrangement = "horizontal",
                               inputs = 2:3,
                               outputs = 4)
# Example 2. If you have a dataset in long format.
data("EconomyLong")
data_example2 <- make_malmquist(EconomyLong,
                                percol = 2,
                                arrangement = "vertical",
                                inputs = 3:4,
                                outputs = 5)
```

malmquist_index *Malmquist index*

Description

This function calculates the input/output oriented Malmquist productivity index under constant or variable returns-to-scale.

Usage

```
malmquist_index(datadealist,
                dmu_eval = NULL,
                dmu_ref = NULL,
                orientation = c("io", "oo"),
                rts = c("crs", "vrs"),
                type1 = c("cont", "seq", "glob"),
                type2 = c("fgnz", "rd", "gl", "bias"),
                tc_vrs = FALSE,
                vtrans_i = NULL,
                vtrans_o = NULL)
```

Arguments

datadealist	A list with the data (deadata objects) at different times, including DMUs, inputs and outputs.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
orientation	A string, equal to "io" (input oriented) or "oo" (output oriented).
rts	A string, determining the type of returns to scale, equal to "crs" (constant) or "vrs" (variable).
type1	A string, equal to "cont" (contemporary), "seq" (sequential) or "glob" (global).
type2	A string, equal to "fgnz" (Fare et al. 1994), "rd" (Ray and Desli 1997), "gl" (generalized) or "bias" (biased).
tc_vrs	Logical. If it is FALSE, it computes the vrs bias malmquist index by using the technical change under crs (Fare and Grosskopf 1996). Otherwise, it uses the technical change under vrs.
vtrans_i	Numeric vector of translation for undesirable inputs in non-directional basic models. If vtrans_i[i] is NA, then it applies the "max + 1" translation to the i-th undesirable input. If vtrans_i is a constant, then it applies the same translation to all undesirable inputs. If vtrans_i is NULL, then it applies the "max + 1" translation to all undesirable inputs.
vtrans_o	Numeric vector of translation for undesirable outputs in non-directional basic models, analogous to vtrans_i, but applied to outputs.

Value

A numeric list with Malmquist index and other parameters.

Note

In the results: EC = Efficiency Change, PTEC = Pure Technical Efficiency Change, SEC = Scale Efficiency Change, TC = Technological Change, MI = Malmquist Index

mi_gl <- result_gl$mi
```

`maximal_friends` *Maximal friends of a set of DMUs.*

Description

Finds the maximal friends subsets of a given set of DMUs, according to Tone (2010). It uses an ascending algorithm in order to find directly maximal subsets.

Usage

```
maximal_friends(datadea,
             dmu_ref = NULL,
             rts = c("crs", "vrs", "nirs", "ndrs"),
             tol = 1e-6,
             silent = FALSE)
```

Arguments

`datadea`	A `deadata` object with `n` DMUs, `m` inputs and `s` outputs.
`dmu_ref`	A numeric vector containing which DMUs are the evaluation reference set, i.e. the cluster of DMUs from which we want to find maximal friends. If `NULL` (default), all DMUs are considered.
`rts`	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing) or "ndrs" (non-decreasing).
`tol`	Numeric, a tolerance margin for checking efficiency. It is 1e-6 by default.
`silent`	Logical, if `FALSE` (default) steps are printed.

Value

A list with numeric vectors representing maximal friends subsets of DMUs.

modelfuzzy_guotanaka *Fuzzy DEA model*

Description

Solve the Fuzzy input-oriented and output-oriented DEA model proposed by Guo and Tanaka (2001) under constant returns to scale. In deaR is implemented the LP poblem given by the model (16) in Guo and Tanaka (2001, p.155). The fuzzy efficiencies are calculated according to equations in (17) (Guo and Tanaka, 2001, p.155). The (crisp) relative efficiencies and multipliers for the case h = 1 are obtained from the CCR model (model_multiplier).

Usage

```
modelfuzzy_guotanaka(datadea,
                     dmu_eval = NULL,
                     dmu_ref = NULL,
                     orientation = c("io", "oo"),
                     h = 1)
```

Arguments

datadea	A deadata_fuzzy object, including DMUs, inputs and outputs.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.

orientation	A string, equal to "io" (input oriented) or "oo" (output oriented).
h	A numeric vector with the h-levels (in [0,1]).

Value

An object of class deadata_fuzzy.

Note

The optimal solution of model (16) is not unique.

`modelfuzzy_kaoliu` *Fuzzy DEA model.*

Description

Solve the fuzzy DEA model by Kao and Liu (2000)

Usage

```
modelfuzzy_kaoliu(datadea,
                  dmu_eval = NULL,
                  kaoliu_modelname = c("basic", "additive", "addsupereff",
                    "deaps", "fdh", "multiplier", "nonradial", "profit",
                    "rdm", "sbmeff", "sbmsupereff", "supereff"),
                  alpha = 1,
                  ...)
```

Arguments

`datadea`	A `deadata_fuzzy` object, including DMUs, inputs and outputs.
`dmu_eval`	A numeric vector containing which DMUs have to be evaluated. If `NULL` (default), all DMUs are considered.
`kaoliu_modelname`	a string containing the name of the model.
`alpha`	A numeric vector with the alpha-cuts (in [0,1]). If `alpha`>1, it determines the number of alpha-cuts, equispatially distributed in [0,1].
`...`	`dmu_ref`, `orientation`, `rts` and other model parameters.

Value

An object of class `deadata_fuzzy`.

`modelfuzzy_possibilistic` *Possibilistic Fuzzy DEA model.*

Description

Solve the possibilistic fuzzy DEA model proposed by León et. al (2003).

Usage

```
modelfuzzy_possibilistic(datadea,
                         dmu_eval = NULL,
                         poss_modelname = c("basic"),
                         h = 1,
                         ...)
```

Arguments

`datadea`	A `deadata_fuzzy` object, including DMUs, inputs and outputs.
`dmu_eval`	A numeric vector containing which DMUs have to be evaluated. If `NULL` (default), all DMUs are considered.
`poss_modelname`	a string containing the name of the model.
`h`	A numeric vector with the h-levels (in [0,1]).
`...`	`dmu_ref`, `orientation`, `rts` and other model parameters.

Value

An object of class `deadata_fuzzy`.

model_additive *Additive DEA model.*

Description

Solve the additive model of Charnes et. al (1985). With the current version of deaR, it is possible to solve input-oriented, output-oriented, and non-oriented additive model under constant and non-constant returns to scale.

Besides, the user can set weights for the input slacks and/or output slacks. So, it is also possible to solve weighted additive models. For example: Measure of Inefficiency Proportions (MIP), Range Adjusted Measure (RAM), etc.

Usage

```
model_additive(datadea,
               dmu_eval = NULL,
               dmu_ref = NULL,
               orientation = NULL,
               weight_slack_i = 1,
               weight_slack_o = 1,
               rts = c("crs", "vrs", "nirs", "ndrs", "grs"),
               L = 1,
               U = 1,
               compute_target = TRUE,
               returnlp = FALSE,
               ...)
```

Arguments

datadea	A deadata object with n DMUs, m inputs and s outputs.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
orientation	This parameter is either NULL (default) or a string, equal to "io" (input-oriented) or "oo" (output-oriented). It is used to modify the weight slacks. If input-oriented, weight_slack_o are taken 0. If output-oriented, weight_slack_i are taken 0.
weight_slack_i	A value, vector of length m, or matrix m x ne (where ne is the length of dmu_eval) with the weights of the input slacks. If 0, output-oriented.
weight_slack_o	A value, vector of length s, or matrix s x ne (where ne is the length of dmu_eval) with the weights of the output slacks. If 0, input-oriented.
rts	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing), "ndrs" (non-decreasing) or "grs" (generalized).
L	Lower bound for the generalized returns to scale (grs).
U	Upper bound for the generalized returns to scale (grs).
compute_target	Logical. If it is TRUE, it computes targets.

returnlp	Logical. If it is TRUE, it returns the linear problems (objective function and constraints).
...	Ignored, for compatibility issues.

Note

In this model, the efficiency score is the sum of the slacks. Therefore, a DMU is efficient when the objective value (objval) is zero.

slacks(result3)
```

`model_addmin` *Additive-min DEA model.*

Description

Solve the weighted version of the additive-min (mADD) model of Aparicio et. al (2007) with different returns to scale. For non constant returns to scale, a modification given by Zhu et al. (2018) is done.

Usage

```
model_addmin(datadea,
             dmu_eval = NULL,
```

```
dmu_ref = NULL,
orientation = NULL,
weight_slack_i = 1,
weight_slack_o = 1,
rts = c("crs", "vrs", "nirs", "ndrs"),
method = c("mf", "milp"),
extreff = NULL,
M_d = NULL,
M_lambda = 1e3,
maxfr = NULL,
tol = 1e-6,
silent = TRUE,
compute_target = TRUE,
check_target = FALSE,
returnlp = FALSE,
...)
```

Arguments

datadea	A deadata object with n DMUs, m inputs and s outputs.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
orientation	This parameter is either NULL (default) or a string, equal to "io" (input-oriented) or "oo" (output-oriented). It is used to modify the weight slacks. If input-oriented, weight_slack_o are taken 0. If output-oriented, weight_slack_i are taken 0.
weight_slack_i	A value, vector of length m, or matrix m x ne (where ne is the length of dmu_eval) with the weights of the input slacks. If 0, output-oriented.
weight_slack_o	A value, vector of length s, or matrix s x ne (where ne is the length of dmu_eval) with the weights of the output slacks. If 0, input-oriented.
rts	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing) or "ndrs" (non-decreasing). Under non-increasing or non-decreasing returns to scale, you may set check_target = TRUE because methods are not reliable. Generalized returns to scale are not available.
method	A string with the method: "mf" (default) for maximal friends, or "milp" for the mixed integer linear program of Aparicio et al. (2007). MILP method is faster but very problematic numerically.
extreff	A vector with the extreme efficient DMUs for "milp" method, as it is returned by function extreme_efficient. If NULL (default) this vector is computed internally.
M_d	Numeric, a big positive quantity for "milp" method. It is an upper bound for auxiliary variables named "d" in Aparicio (2007). If NULL (default), it is estimated automatically. A very big value can produce catastrophic cancellations. If the results are not correct or the solver hangs, try to change its value.

M_lambda	Numeric, a big positive quantity for "milp" method. It is an upper bound for lambda variables. A very big value can produce catastrophic cancellations. If the results are not correct or the solver hangs, try to change its value (1e3 by default).
maxfr	A list with the maximal friends sets for "mf" method, as it is returned by function maximal_friends. If NULL (default) this list is computed internally.
tol	Numeric, a tolerance margin for checking efficiency in extreme_efficient or maximal_friends functions, and for checking targets.
silent	Logical. If FALSE, it prints all the messages from function maximal_friends.
compute_target	Logical. If it is TRUE (default), it computes targets.
check_target	Logical. If it is TRUE, it checks the efficiency of targets. If a target is not efficient, the method has failed.
returnlp	Logical. If it is TRUE, it returns the linear problems (objective function and constraints).
...	For compatibility issues.

Note

In this model, the efficiency score is the sum of the slacks. Therefore, a DMU is efficient when the objective value (objval) is zero.

`model_addsupereff` *Additive super-efficiency DEA model.*

Description

Solve the additive super-efficiency model proposed by Du, Liang and Zhu (2010). It is an extension of the SBM super-efficiency to the additive DEA model.

Usage

```
model_addsupereff(datadea,
                  dmu_eval = NULL,
                  dmu_ref = NULL,
                  orientation = NULL,
                  weight_slack_i = NULL,
                  weight_slack_o = NULL,
                  rts = c("crs", "vrs", "nirs", "ndrs", "grs"),
                  L = 1,
                  U = 1,
                  compute_target = TRUE,
                  returnlp = FALSE,
                  ...)
```

Arguments

datadea	A deadata object with n DMUs, m inputs and s outputs.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
orientation	This parameter is either NULL (default) or a string, equal to "io" (input-oriented) or "oo" (output-oriented). It is used to modify the weight slacks. If input-oriented, weight_slack_o are taken 0. If output-oriented, weight_slack_i are taken 0.
weight_slack_i	A value, vector of length m, or matrix m x ne (where ne is the length of dmu_eval) with the weights of the input super-slacks (t_input). If 0, output-oriented. If weight_slack_i is the matrix of the inverses of inputs of DMUS in dmu_eval (default), the model is unit invariant.
weight_slack_o	A value, vector of length s, or matrix s x ne (where ne is the length of dmu_eval) with the weights of the output super-slacks (t_output). If 0, input-oriented. If weight_slack_o is the matrix of the inverses of outputs of DMUS in dmu_eval (default), the model is unit invariant.
rts	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing), "ndrs" (non-decreasing) or "grs" (generalized).
L	Lower bound for the generalized returns to scale (grs).
U	Upper bound for the generalized returns to scale (grs).
compute_target	Logical. If it is TRUE, it computes targets, projections and slacks.
returnlp	Logical. If it is TRUE, it returns the linear problems (objective function and constraints).
...	Ignored, for compatibility issues.

model_basic *Basic (radial and directional) DEA model.*

Description

It solves input and output oriented, along with directional, basic DEA models (envelopment form) under constant (CCR model), variable (BCC model), non-increasing, non-decreasing or generalized returns to scale. By default, models are solved in a two-stage process (slacks are maximized).

You can use the model_basic function to solve directional DEA models by choosing orientation = "dir".

The model_basic function allows to treat with non-discretional, non-controllable and undesirable inputs/outputs.

Usage

```
model_basic(datadea,
            dmu_eval = NULL,
            dmu_ref = NULL,
            orientation = c("io", "oo", "dir"),
            dir_input = NULL,
            dir_output = NULL,
            rts = c("crs", "vrs", "nirs", "ndrs", "grs"),
            L = 1,
            U = 1,
            maxslack = TRUE,
            weight_slack_i = 1,
            weight_slack_o = 1,
            vtrans_i = NULL,
            vtrans_o = NULL,
            compute_target = TRUE,
            compute_multiplier = FALSE,
            returnlp = FALSE,
            silent_ud = FALSE,
            ...)
```

Arguments

datadea	A deadata object with n DMUs, m inputs and s outputs.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
orientation	A string, equal to "io" (input oriented), "oo" (output oriented), or "dir" (directional).
dir_input	A value, vector of length m, or matrix m x ne (where ne is the length of dmu_eval) with the input directions. If dir_input == input matrix (of DMUS in dmu_eval) and dir_output == 0, it is equivalent to input oriented (beta = 1 - efficiency). If dir_input is omitted, input matrix (of DMUS in dmu_eval) is assigned.
dir_output	A value, vector of length s, or matrix s x ne (where ne is the length of dmu_eval) with the output directions. If dir_input == 0 and dir_output == output matrix (of DMUS in dmu_eval), it is equivalent to output oriented (beta = efficiency - 1). If dir_output is omitted, output matrix (of DMUS in dmu_eval) is assigned.
rts	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing), "ndrs" (non-decreasing) or "grs" (generalized).
L	Lower bound for the generalized returns to scale (grs).
U	Upper bound for the generalized returns to scale (grs).
maxslack	Logical. If it is TRUE, it computes the max slack solution.

`weight_slack_i` A value, vector of length `m`, or matrix `m` x `ne` (where `ne` is the length of `dmu_eval`) with the weights of the input slacks for the max slack solution.

`weight_slack_o` A value, vector of length `s`, or matrix `s` x `ne` (where `ne` is the length of `dmu_eval`) with the weights of the output slacks for the max slack solution.

`vtrans_i` Numeric vector of translation for undesirable inputs with non-directional orientation. If `vtrans_i[i]` is `NA`, then it applies the "max + 1" translation to the i-th undesirable input. If `vtrans_i` is a constant, then it applies the same translation to all undesirable inputs. If `vtrans_i` is `NULL`, then it applies the "max + 1" translation to all undesirable inputs.

`vtrans_o` Numeric vector of translation for undesirable outputs with non-directional orientation, analogous to `vtrans_i`, but applied to outputs.

`compute_target` Logical. If it is `TRUE`, it computes targets of the max slack solution.

`compute_multiplier` Logical. If it is `TRUE`, it computes multipliers (dual solution) when `orientation` is "io" or "oo".

`returnlp` Logical. If it is `TRUE`, it returns the linear problems (objective function and constraints) of stage 1.

`silent_ud` Logical. For internal use, to avoid multiple warnings in the execution of `malmquist_index` function with undesirable variables.

`...` Ignored, for compatibility issues.

Note

(1) Model proposed by Seiford and Zhu (2002) is applied for undesirable inputs/outputs and non-directional orientation (i.e., input or output oriented). You should select "vrs" returns to scale (BCC model) in order to maintain translation invariance. If deaR detects that you are not specifying `rts` = "vrs", it makes the change to "vrs" automatically.

(2) With undesirable inputs and non-directional orientation use input-oriented BCC model, and with undesirable outputs and non-directional orientation use output-oriented BCC model. Alternatively, you can also treat the undesirable outputs as inputs and then apply the input-oriented BCC model (similarly with undesirable inputs).

(3) Model proposed by Fare and Grosskopf (2004) is applied for undesirable inputs/outputs and directional orientation.

(4) With `orientation` = "dir" (directional distance function model), efficient DMUs are those for which `beta` = 0.

```

`model_deaps` *Preference Structure DEA model.*

Description

With this non-radial DEA model (Zhu, 1996), the user can specify the preference input (or output) weigths that reflect the relative degree of desirability of the adjustments of the current input (or output) levels.

Usage

```
model_deaps(datadea,
            dmu_eval = NULL,
            dmu_ref = NULL,
            weight_eff = 1,
            orientation = c("io", "oo"),
            rts = c("crs", "vrs", "nirs", "ndrs", "grs"),
            L = 1,
            U = 1,
            restricted_eff = TRUE,
            maxslack = TRUE,
            weight_slack = 1,
            compute_target = TRUE,
            returnlp = FALSE,
            ...)
```

Arguments

datadea	A deadata object, including n DMUs, m inputs and s outputs.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
weight_eff	Preference weights. If input-oriented, it is a value, vector of length m, or matrix m x ne (where ne is the lenght of dmu_eval) with the weights applied to the input efficiencies. If output-oriented, it is a value, vector of length s, or matrix s x ne with the weights applied to the output efficiencies.
orientation	A string, equal to "io" (input-oriented) or "oo" (output-oriented).
rts	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing), "ndrs" (non-decreasing) or "grs" (generalized).
L	Lower bound for the generalized returns to scale (grs).
U	Upper bound for the generalized returns to scale (grs).
restricted_eff	Logical. If it is TRUE, the efficiencies are restricted to be <=1 (input-oriented) or >=1 (output-oriented).
maxslack	Logical. If it is TRUE, it computes the max slack solution.
weight_slack	If input-oriented, it is a value, vector of length s, or matrix s x ne with the weights of the output slacks for the max slack solution. If output-oriented, it is a value, vector of length m, or matrix m x ne with the weights of the input slacks for the max slack solution.
compute_target	Logical. If it is TRUE, it computes targets of the max slack solution.
returnlp	Logical. If it is TRUE, it returns the linear problems (objective function and constraints) of stage 1.
...	Ignored, for compatibility issues.

model_fdh *Free disposal hull (FDH) model.*

Description

FDH model allows the free disposability to construct the production possibility set. The central feature of the FDH model is the lack of convexity for its production possibility set (Thrall, 1999).

Usage

```
model_fdh(datadea,
          fdh_modelname = c("basic"),
          ...)
```

Arguments

datadea	A deadata object, including DMUs, inputs and outputs.
fdh_modelname	A string containing the name of the model to apply FDH. For now, only "basic" is available.
...	dmu_eval, dmu_ref, orientation and other model parameters. Parameters like rts, max_slack and returnlp are ignored.

efficiencies(result2)
```

`model_multiplier` *Multiplier DEA model*

Description

Solve input-oriented and output-oriented basic DEA models (multiplicative form) under constant (CCR DEA model), variable (BCC DEA model), non-increasing, non-decreasing or generalized returns to scale. It does not take into account non-controllable, non-discretionary or undesirable inputs/outputs.

Usage

```
model_multiplier(datadea,
                 dmu_eval = NULL,
                 dmu_ref = NULL,
                 epsilon = 0,
                 orientation = c("io", "oo"),
                 rts = c("crs", "vrs", "nirs", "ndrs", "grs"),
                 L = 1,
                 U = 1,
                 returnlp = FALSE,
                 compute_lambda = TRUE,
                 ...)
```

Arguments

`datadea`	A `deadata` object, including DMUs, inputs and outputs.
`dmu_eval`	A numeric vector containing which DMUs have to be evaluated. If `NULL` (default), all DMUs are considered.
`dmu_ref`	A numeric vector containing which DMUs are the evaluation reference set. If `NULL` (default), all DMUs are considered.
`epsilon`	Numeric, multipliers must be >= `epsilon`.
`orientation`	A string, equal to "io" (input-oriented) or "oo" (output-oriented).
`rts`	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing), "ndrs" (non-decreasing) or "grs" (generalized).
`L`	Lower bound for the generalized returns to scale (grs).
`U`	Upper bound for the generalized returns to scale (grs).
`returnlp`	Logical. If it is `TRUE`, it returns the linear problems (objective function and constraints).
`compute_lambda`	Logical. If it is `TRUE`, it computes the dual problem and lambdas.
`...`	Ignored, for compatibility issues.

Note

(1) Very important with the multiplier model: "The optimal weights for an efficient DMU need not be unique" (Cooper, Seiford and Tone, 2007:31). "Usually, the optimal weights for inefficient DMUs are unique, the exception being when the line of the DMU is parallel to one of the boundaries of the feasible region" (Cooper, Seiford and Tone, 2007:32).

(2) The measure of technical input (or output) efficiency obtained by using multiplier DEA models is better the smaller the value of epsilon.

(3) Epsilon is usually set equal to 10^-6. However, if epsilon is not set correctly, the multiplier model can be infeasible (Zhu,2014:49).

`model_nonradial` *Non-radial DEA model.*

Description

Non-radial DEA model allows for non-proportional reductions in each input or augmentations in each output.

Usage

```
model_nonradial(datadea,
                dmu_eval = NULL,
                dmu_ref = NULL,
                orientation = c("io", "oo"),
                rts = c("crs", "vrs", "nirs", "ndrs", "grs"),
                L = 1,
                U = 1,
                maxslack = TRUE,
                weight_slack = 1,
                compute_target = TRUE,
                returnlp = FALSE,
                ...)
```

Arguments

datadea	A deadata object, including n DMUs, m inputs and s outputs.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
orientation	A string, equal to "io" (input-oriented) or "oo" (output-oriented).
rts	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing), "ndrs" (non-decreasing) or "grs" (generalized).
L	Lower bound for the generalized returns to scale (grs).
U	Upper bound for the generalized returns to scale (grs).
maxslack	Logical. If it is TRUE, it computes the max slack solution.
weight_slack	If input-oriented, it is a value, vector of length s, or matrix s x ne (where ne is the length of dmu_eval) with the weights of the output slacks for the max slack solution. If output-oriented, it is a value, vector of length m, or matrix m x ne with the weights of the input slacks for the max slack solution.
compute_target	Logical. If it is TRUE, it computes targets of the max slack solution.
returnlp	Logical. If it is TRUE, it returns the linear problems (objective function and constraints) of stage 1.
...	Ignored, for compatibility issues.

model_profit *Profit efficiency DEA model.*

Description

Cost, revenue and profit efficiency DEA models.

Usage

```
model_profit(datadea,
             dmu_eval = NULL,
             dmu_ref = NULL,
             price_input = NULL,
             price_output = NULL,
             rts = c("crs", "vrs", "nirs", "ndrs", "grs"),
             L = 1,
             U = 1,
             restricted_optimal = TRUE,
             returnlp = FALSE,
             ...)
```

Arguments

datadea	A deadata object, including n DMUs, m inputs and s outputs.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
price_input	Unit prices of inputs for cost or profit efficiency models. It is a value, vector of length m, or matrix m x ne (where ne is the length of dmu_eval).

price_output	Unit prices of outputs for revenue or profit efficiency models. It is a value, vector of length s, or matrix s x ne.
rts	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing), "ndrs" (non-decreasing) or "grs" (generalized).
L	Lower bound for the generalized returns to scale (grs).
U	Upper bound for the generalized returns to scale (grs).
restricted_optimal	Logical. If it is TRUE, the optimal inputs are restricted to be <= inputs (for cost efficiency models) or the optimal outputs are restricted to be >= outputs (for revenue efficiency models).
returnlp	Logical. If it is TRUE, it returns the linear problems (objective function and constraints) of stage 1.
...	Ignored, for compatibility issues.

```

`model_rdm` *Range directional model.*

Description

Range directional model from Portela et al. (2004).

Usage

```
model_rdm(datadea,
            dmu_eval = NULL,
            dmu_ref = NULL,
            orientation = c("no", "io", "oo"),
            irdm = FALSE,
            maxslack = TRUE,
            weight_slack_i = 1,
```

```
              weight_slack_o = 1,
              compute_target = TRUE,
              returnlp = FALSE,
              ...)
```

Arguments

datadea	A deadata object, including n DMUs, m inputs and s outputs.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
orientation	A string, equal to "no" (non-oriented), "io" (input oriented), or "oo" (output oriented).
irdm	Logical. If it is TRUE, it applies the IRDM (inverse range directional model).
maxslack	Logical. If it is TRUE, it computes the max slack solution.
weight_slack_i	A value, vector of length m, or matrix m x ne (where ne is the length of dmu_eval) with the weights of the input slacks for the max slack solution.
weight_slack_o	A value, vector of length s, or matrix s x ne (where ne is the length of dmu_eval) with the weights of the output slacks for the max slack solution.
compute_target	Logical. If it is TRUE, it computes targets of the max slack solution.
returnlp	Logical. If it is TRUE, it returns the linear problems (objective function and constraints) of stage 1.
...	Ignored, for compatibility issues.

Note

Undesirable inputs/outputs are treated as negative inputs/outputs in this model.

`model_sbmeff` *Slack based measure (SBM) of efficiency model.*

Description

Calculate the SBM model proposed by Tone (2001).

Usage

```
model_sbmeff(datadea,
             dmu_eval = NULL,
             dmu_ref = NULL,
             weight_input = 1,
             weight_output = 1,
             orientation = c("no", "io", "oo"),
             rts = c("crs", "vrs", "nirs", "ndrs", "grs"),
             L = 1,
             U = 1,
             kaizen = FALSE,
             maxfr = NULL,
             tol = 1e-6,
             silent = FALSE,
             compute_target = TRUE,
             returnlp = FALSE,
             ...)
```

Arguments

`datadea`	A `deadata` object with `n` DMUs, `m` inputs and `s` outputs.
`dmu_eval`	A numeric vector containing which DMUs have to be evaluated. If `NULL` (default), all DMUs are considered.
`dmu_ref`	A numeric vector containing which DMUs are the evaluation reference set. If `NULL` (default), all DMUs are considered.
`weight_input`	A value, vector of length `m`, or matrix `m` x `ne` (where `ne` is the length of `dmu_eval`) with weights to inputs corresponding to the relative importance of items.
`weight_output`	A value, vector of length `m`, or matrix `m` x `ne` (where `ne` is the length of `dmu_eval`) with weights to outputs corresponding to the relative importance of items.
`orientation`	A string, equal to "no" (non-oriented), "io" (input-oriented) or "oo" (output-oriented).
`rts`	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing), "ndrs" (non-decreasing) or "grs" (generalized).
`L`	Lower bound for the generalized returns to scale (grs).
`U`	Upper bound for the generalized returns to scale (grs).

kaizen	Logical. If TRUE, the kaizen version of SBM (Tone 2010), also known as SBM-Max, is computed.
maxfr	A list with the maximal friends sets, as it is returned by function maximal_friends. If NULL (default) this list is computed internally.
tol	Numeric, a tolerance margin for checking efficiency (only for the kaizen version).
silent	Logical. If FALSE (default) it prints all the messages from function maximal_friends.
compute_target	Logical. If it is TRUE, it computes targets.
returnlp	Logical. If it is TRUE, it returns the linear problems (objective function and constraints). If kaizen is TRUE it is ignored.
...	Other options (currently not implemented)

`model_sbmsupereff` *Slack based measure of superefficiency model*

Description

Slack based measure of superefficiency model (Tone 2002) with `n` DMUs, `m` inputs and `s` outputs.

Usage

```
model_sbmsupereff(datadea,
                  dmu_eval = NULL,
                  dmu_ref = NULL,
                  weight_input = 1,
                  weight_output = 1,
                  orientation = c("no", "io", "oo"),
                  rts = c("crs", "vrs", "nirs", "ndrs", "grs"),
                  L = 1,
                  U = 1,
                  compute_target = TRUE,
```

```
                    compute_rho = FALSE,
                    kaizen = FALSE,
                    silent = FALSE,
                    returnlp = FALSE)
```

Arguments

datadea	A deadata object, including DMUs, inputs and outputs.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
weight_input	A value, vector of length m, or matrix m x ne (where ne is the length of dmu_eval) with weights to inputs corresponding to the relative importance of items.
weight_output	A value, vector of length m, or matrix m x ne (where ne is the length of dmu_eval) with weights to outputs corresponding to the relative importance of items.
orientation	A string, equal to "no" (non-oriented), "io" (input-oriented) or "oo" (output-oriented).
rts	A string, determining the type of returns to scale, equal to "crs" (constant), "vrs" (variable), "nirs" (non-increasing), "ndrs" (non-decreasing) or "grs" (generalized).
L	Lower bound for the generalized returns to scale (grs).
U	Upper bound for the generalized returns to scale (grs).
compute_target	Logical. If it is TRUE, it computes targets, superslacks (t_input and t_output) and slacks.
compute_rho	Logical. If it is TRUE, it computes the SBM efficiency score (applying model_sbmeff) of the DMU (project_input, project_output).
kaizen	Logical. If TRUE, the kaizen version of SBM (Tone 2010), also known as SBM-Max, is computed for the efficiency score of the DMU (project_input, project_output).
silent	Logical. If FALSE (default) it prints all the messages from function maximal_friends.
returnlp	Logical. If it is TRUE, it returns the linear problems (objective function and constraints).

model_supereff *Radial super-efficiency basic DEA model*

Description

Solve Andersen and Petersen radial Super-efficiency DEA model.

Usage

```
model_supereff(datadea,
               dmu_eval = NULL,
               dmu_ref = NULL,
               supereff_modelname = c("basic"),
               ...)
```

Arguments

datadea	An object of class deadata.
dmu_eval	A numeric vector containing which DMUs have to be evaluated. If NULL (default), all DMUs are considered.
dmu_ref	A numeric vector containing which DMUs are the evaluation reference set. If NULL (default), all DMUs are considered.
supereff_modelname	A string containing the name of the radial model to apply super-efficiency.
...	orientation, rts and other model parameters.

Note

(1) Radial super-efficiency model under variable (vrs, nirs, ndrs, grs) returns to scale can be infeasible for certain DMUs. See example 2.

(2) DMUs with infeasible solution are not shown in the results.

                          rts = "vrs")
eff2 <- efficiencies(result2)
```

`multipliers` *Multipliers*

Description

Extract the multipliers of the DMUs from a `dea` or `dea_fuzzy` solution.

Usage

```
multipliers(deasol)
```

Arguments

`deasol`	Object of class `dea` or `dea_fuzzy` obtained with some of the DEA model functions.

Author(s)

Vicente Coll-Serrano (<vicente.coll@uv.es>). *Quantitative Methods for Measuring Culture (MC2). Applied Economics.*

Examples

```
data("Coll_Blasco_2006")
data_example <- make_deadata(Coll_Blasco_2006,
                             ni = 2,
                             no = 2)
result <- model_multiplier(data_example,
                           orientation = "io",
                           rts = "crs")
multipliers(result)
```

PFT1981 *Data: Charnes, Cooper and Rhodes (1981).*

Description

Data from Project Follow Through (PTF) in public school education. There are 49 DMUs (school sites) in PFT and 21 DMUs in Non-Follow Through (NFT). Authors consider 3 outputs (Y) and 5 inputs (X).

Usage

```
data("PFT1981")
```

Format

Data frame with 70 rows and 10 columns. Definition of inputs (X) and outputs (Y):

Y1 = Reading Total Reading Scores (as measured by the Metropolitan Achievement Test).

Y2 = Math Total Math Scores (total mathematics score by the Metropolitan Achievement Test.

Y3 = Coopersmith Total Coopersmith Scores (Coopersmith self-esteem inventory, intended as a measure of self-esteem).

X1 = Education Education level of mother (as measured in terms of percentage of high school graduates among female parents).

X2 = Occupation Occupation Index (highest occupation of a family member according to a pre-arranged rating scale).

X3 = Parental Parental Visit Index (representing the number of visits to the school site).

X4 = Counseling Counseling Index (parent counselling index calculated from data on time spent with child on school-related topics such as reading together, etc.).

X5 = Teachers Number of Teachers (number of teachers at a given site).

Program PFT or NFT.

plot.dea *Plot for DEA models.*

Description

Plot some attribute of a DEA model.

Usage

```
## S3 method for class 'dea'
plot(x, tol = 1e-04, showPlots = TRUE, ...)
```

Arguments

x	An object of class dea obtained by a DEA model function.
tol	Numeric. Absolute tolerance for numeric comparisons. By default, it is 1e-4.

showPlots	Logical. When TRUE (default) the plots are shown one by one. When it is FALSE the plots are not shown and are returned by the function (invisibly) as a list.
...	Ignored, for compatibility issues.

Value

Depending on the model, it returns some plots.

Power_plants *Data: Tone (2002).*

Description

This dataset consists of six power plants with 4 inputs (X) and 2 outputs (Y).

Usage

```
data("Power_plants")
```

Format

Data frame with 15 rows and 7 columns. Definition of inputs (X) and outputs (Y):

x1 Manpower requiered

x2 Construction costs in millions of dollars

x3 Annual maintenance costs in millions of dollars

x4 Number of villages to be evacuated

y1 Power generated in megawatts

y2 Safety level

`read_data` *read_data*

Description

This function is deprecated. Use `make_deadata` instead.

Usage

```
read_data(datadea = NULL,
          ni = NULL,
          no = NULL,
          dmus = 1,
          inputs = NULL,
          outputs = NULL,
          nc_inputs = NULL,
          nc_outputs = NULL,
          nd_inputs = NULL,
          nd_outputs = NULL,
          ud_inputs = NULL,
          ud_outputs = NULL)
```

Arguments

`datadea`	Data frame with DEA data.
`ni`	Number of inputs, if inputs are in columns 2:(`ni` + 1) (if DMUs are in the first column) or 1:`ni` (no DMUs column).
`no`	Number of outputs, if outputs are in columns (`ni` + 2):(`ni` + `no` + 1) (if DMUs are in the first column) or (`ni` + 1):(`ni` + `no`) (no DMUs column). If not specified, DMUs are in the first column.
`dmus`	Column (number or name) of DMUs (optional). By default, it is the first column. If there is not any DMU column, then it must be `NULL`.
`inputs`	Columns (numbers or names) of inputs (optional). It prevails over `ni`. Alternatively to `datadea`, it can be a matrix with the inputs (DMUs in columns). In this case, DMUs names are taken from the columns names.
`outputs`	Columns (numbers or names) of outputs (optional). It prevails over `no`. Alternatively to `datadea`, it can be a matrix with the outputs (DMUs in columns).

nc_inputs	A numeric vector containing the indices of non-controllable inputs.
nc_outputs	A numeric vector containing the indices of non-controllable outputs.
nd_inputs	A numeric vector containing the indices of non-discretionary inputs.
nd_outputs	A numeric vector containing the indices of non-discretionary outputs.
ud_inputs	A numeric vector containing the indices of undesirable (good) inputs.
ud_outputs	A numeric vector containing the indices of undesirable (bad) outputs.

---

read_data_fuzzy *read_data_fuzzy*

Description

This function is deprecated. Use make_deadata_fuzzy instead.

Usage

```
read_data_fuzzy(datadea,
                dmus = 1,
                inputs.mL = NULL,
                inputs.mR = NULL,
                inputs.dL = NULL,
                inputs.dR = NULL,
                outputs.mL = NULL,
                outputs.mR = NULL,
                outputs.dL = NULL,
                outputs.dR = NULL,
                nc_inputs = NULL,
                nc_outputs = NULL,
                nd_inputs = NULL,
                nd_outputs = NULL,
                ud_inputs = NULL,
                ud_outputs = NULL)
```

Arguments

datadea	Data frame with DEA data.
dmus	Column (number or name) of DMUs (optional). By default, it is the first column. If there is not any DMU column, then it must be NULL.
inputs.mL	Where are (columns) the mL (left centers) of trapezoidal fuzzy inputs in datadea. If an input is triangular or crisp, we put the column where the centers or the crisp values are, respectively. Alternatively to datadea, inputs.mL can be a matrix of size (number of inputs x number of DMUs) with the mL of trapezoidal fuzzy inputs, the centers of triangular inputs, and the crisp values of crisp inputs. In this case, DMUs names are taken from the columns names.

inputs.mR	Where are (columns) the mR (right centers) of trapezoidal fuzzy inputs in datadea. If an input is triangular or crisp, we put NA. Alternatively to datadea, inputs.mR can be a matrix of size (number of inputs x number of DMUs) with the mR of trapezoidal fuzzy inputs, the centers of triangular inputs, and the crisp values of crisp inputs. If all inputs are triangular or crisp, then inputs.mR must be NULL (default) or equal to inputs.mL.
inputs.dL	Where are (columns) the dL (left radii) of trapezoidal and triangular fuzzy inputs in datadea. If an input is symmetric, we put the column where the radii are. If an input is rectangular or crisp, we put NA. Alternatively to datadea, inputs.dL can be a matrix of size (number of inputs x number of DMUs) with the dL of trapezoidal and triangular fuzzy inputs. If an input is rectangular or crisp, its radius is zero. If all inputs are rectangular or crisp, then inputs.dL must be NULL (default) or a zero matrix.
inputs.dR	Where are (columns) the dR (right radii) of trapezoidal and triangular fuzzy inputs in datadea. If an input is symmetric, rectangular or crisp, we put NA. Alternatively to datadea, inputs.dR can be a matrix of size (number of inputs x number of DMUs) with the dR of trapezoidal and triangular fuzzy inputs. If an input is rectangular or crisp, its radius is zero. If all inputs are symmetric, rectangular or crisp, then inputs.dR must be NULL (default) or equal to inputs.dL.
outputs.mL	Analogous to inputs.mL, but relating to outputs.
outputs.mR	Analogous to inputs.mR, but relating to outputs.
outputs.dL	Analogous to inputs.dL, but relating to outputs.
outputs.dR	Analogous to inputs.dR, but relating to outputs.
nc_inputs	A numeric vector containing the indices of non-controllable inputs.
nc_outputs	A numeric vector containing the indices of non-controllable outputs.
nd_inputs	A numeric vector containing the indices of non-discretionary inputs.
nd_outputs	A numeric vector containing the indices of non-discretionary outputs.
ud_inputs	A numeric vector containing the indices of undesirable (good) inputs.
ud_outputs	A numeric vector containing the indices of undesirable (bad) outputs.

---

read_malmquist *read_malmquist*

Description

This function is deprecated. Use make_malmquist instead.

Usage

```
read_malmquist(datadea,
               nper = NULL,
               percol = NULL,
               arrangement  = c("horizontal", "vertical"),
               ...)
```

Arguments

datadea	Data frame with DEA data.
nper	Number of time periods (with dataset in wide format).
percol	Column of time period (with dataset in long format).
arrangement	Horizontal with data in wide format. Vertical with data in long format.
...	Other options to be passed to the make_deadata function.

---

references *References*

Description

Extract the reference set for each DMU (inefficient DMUs and efficicent DMUs that are combination of other efficient DMUs) from a DEA model solution.

Usage

```
references(deasol,
           thr = 1e-4)
```

Arguments

deasol	Object of class dea obtained with some of the DEA model functions.
thr	Tolerance threshold (for avoiding miss detection of efficient DMUs due to round off errors)

Examples

```
# Replication results model DEA1 in Tomkins and Green (1988).
data("Departments")
# Calculate Total income
Departments$Total_income <- Departments[, 5] + Departments[, 6] + Departments[, 7]
data_DEA1 <- make_deadata(Departments,
                          inputs = 9,
                          outputs = c(2, 3, 4, 12))
result <- model_basic(data_DEA1,
                      orientation = "io",
```

```
                        rts = "crs")
references(result) # Table 3 (p.157)
```

`rts` *Returns to scale*

Description

Extract the returns to scale.

Usage

```
rts(deamodel,
           thr = 1e-4)
```

Arguments

`deamodel`	Object of class `dea` obtained with some of the DEA model functions.
`thr`	Threshold for the tolerance for considering something equal to 1. Defaults to 1e-4.

Author(s)

data("Coll_Blasco_2006")
data_example <- make_deadata(Coll_Blasco_2006,
                             ni = 2,
                             no = 2)
result <- model_multiplier(data_example,
                           orientation = "io",
                           rts = "crs")
slacks(result)
```

summary.dea *Summary conventional DEA models.*

Description

Summary of the results obtained by a conventional DEA model.

Usage

```
## S3 method for class 'dea'
summary(object, exportExcel = FALSE, filename = NULL, returnList = FALSE, ...)
```

Arguments

object	An object of class "dea" obtained by a DEA model function.
exportExcel	Logical value. If TRUE (FALSE by default) the results are also exported to an Excel file.
filename	Character string. Absolute file name (including path) of the exported Excel file. If NULL, then the file name will be "ResultsDEA" + timestamp.xlsx.
returnList	Logical value. If TRUE then the results are given as a list of data frames. If FALSE (default) all the data frames are merged into a single data frame.
...	Ignored. Used for compatibility issues.

Value

Depending on the model it returns a single data.frame containing: efficiencies, slacks, lambdas, targets, references or a list of data.frames with the cross-efficiencies computed with different methods (Arbitrary, Method II or Method III (see CITA)) or, in case the model is a Malmquist index, a single data.frame with the coefficients for the different periods.

`summary.dea_fuzzy` *Summary Fuzzy DEA models.*

Description

Summary of the results obtained by a fuzzy DEA model.

Usage

```
## S3 method for class 'dea_fuzzy'
summary(object, ..., exportExcel = FALSE, filename = NULL, returnList = FALSE)
```

Arguments

`object`	An object of class `"dea_fuzzy"` obtained with a fuzzy DEA model function (`modelfuzzy_guotanaka`, `modelfuzzy_kaoliu`, `modelfuzzy_possibilistic`).
`...`	Extra options.
`exportExcel`	Logical value. If TRUE (FALSE by default) the results are also exported to an Excel file.
`filename`	Character string. Absolute file name (including path) of the exported Excel file. If NULL, then the file name will be "ResultsDEA" + timestamp.xlsx.
`returnList`	Logical value. If TRUE then the results are given as a list of data frames. If FALSE (default) all the data frames are merged into a single data frame.

Value

If the model is that from Guo and Tanaka (`modelfuzzy_guotanaka`), it returns a data.frame with columns: DMU, alpha cuts and efficiencies. For the possibilistic model (`modelfuzzy_possibilistic`) it returns a data.frame with columns: DMU, alpha-cuts, efficiencies and the corresponding lambda values For the Kao-Liu model (`modelfuzzy_kaoliu`), the result may depend on the crisp sub-model used. It will contain a data.frame with the efficiencies (if any), the slacks and superslacks (if any), the lambda values and the targets.

If `exportExcel` is TRUE, then an Excel file will be created containing as many sheets as necessary depending on the variables returned.

Supply_Chain *Data: Sanei and Mamizadeh Chatghayeb (2013).*

Description

Data of 17 supply chain (buyer-supplier relationship in manufacturing).

Usage

```
data("Supply_Chain")
```

Format

Data frame with 17 rows and 8 columns. Definition of inputs (X) and outputs (Y):

X1 to X3 Inputs of buyers

I1 to I2 Outputs of buyers, Inputs of suppliers

Y1 to Y2 Outputs of suppliers

targets *Targets*

Description

Extract the targets of the DMUs from a dea or dea_fuzzy solution.

Usage

```
targets(deasol)
```

Arguments

deasol	Object of class dea or dea_fuzzy obtained with some of the DEA model functions.

undesirable_basic *Undesirable inputs and outputs for basic DEA model.*

Description

This function transforms a deadata or deadata_fuzzy class with undesirable inputs/outputs according to Seiford and Zhu (2002). Onwards, it is recommended to use a DEA model with variable returns to scale (vrs).

Usage

```
undesirable_basic(datadea,
                  vtrans_i = NULL,
                  vtrans_o = NULL)
```

Arguments

datadea	A deadata object, including DMUs, inputs and outputs.
vtrans_i	Numeric vector of translation for undesirable inputs. If vtrans_i[i] is NA, then it applies the "max + 1" translation to the i-th undesirable input. If vtrans_i is a constant, then it applies the same translation to all undesirable inputs. If vtrans_i is NULL, then it applies the "max + 1" translation to all undesirable inputs.
vtrans_o	Numeric vector of translation for undesirable outputs, analogous to vtrans_i, but applied to outputs.

Value

An list with the transformed object of class `deadata` or `deadata_fuzzy` and the corresponding translation vectors `vtrans_i` and `vtrans_o`.
