Examples

```r
## Not run:
library(rfacebookstat)
# Auth
token <- fbGetToken(app_id = 000000000000)

# Get statistic
CampStat <- fbGetMarketingStat(accounts_id = "act_0000000000",
level = "campaign", fields = "campaign_name,impressions,clicks",
breakdowns = "age", sorting = "unique_impressions_descending",
filtering = "["field":'age','operator':"IN","value":['18-24','25-34']]]",
date_start = "2016-10-01", date_stop = "2016-10-10",
access_token = token)

## End(Not run)
```

fbAuth

Authorization in Facebook.

Description

Wrapper for fbGetToken() and fbGetLongtimeToken().

Usage

```r
fbAuth(username = getOption("rfacebookstat.username"),
app_id = getOption("rfacebookstat.app_id"),
app_secret = getOption("rfacebookstat.app_secret"),
token_path = fbTokenPath(),
reauth = FALSE,
skip_option = FALSE)
```
fbDeleteAdAccountUsers

Arguments

username          your username on Facebook
app_id            ID of Facebook App
app_secret        Secret of Facebook App
token_path        path to dir with credentials
reauth            boolean, do reauthorization
skip_option       logical, skip access token from options or not

Value

API token object

Author(s)

Alexey Seleznev

Examples

```r
## Not run:
fbAuth()
```

## End(Not run)

---

fbDeleteAdAccountUsers

*Delete users from ad accounts.*

Description

fbDeleteAdAccountUsers is method for remove users access from ad accounts.

Usage

```r
fbDeleteAdAccountUsers(
  user_ids = NULL,
  accounts_id =getOption("rfacebookstat.accounts_id"),
  api_version =getOption("rfacebookstat.api_version"),
  username =getOption("rfacebookstat.username"),
  token_path = fbTokenPath(),
  access_token =getOption("rfacebookstat.access_token"))
```
Arguments

- `accounts_id` vector with ID of your ad account, for example `c("act_00001","act_00002")`.
- `access_token` Your facebook API token.
- `user_ids` vector with users ids who need remove from ad account.
- `username` your username on Facebook
- `token_path` path to dir with credentials
- `api_version` Current Facebook API version.

Details

ads_management permission is required. You need 'Administrator' access to the ad account to remove users

Author(s)

Alexey Seleznev

Examples

```r
## Not run:
#Attach package
library(rfacebookstat)
#Get token, where 0000000000000 is id of your app in facebook
tk <- fbAuth(0000000000000)
#Remove user with id 001 and 002 from accounts act_0001 and act_0002
fbDeleteAdAccountUsers(user_ids = c(001,002),
                        accounts_id = c("act_0001","act_0002"),
                        api_version = "v2.12",
                        access_token = "abcdef123456" )
## End(Not run)
```

---

### fbGetAdAccountCustomAudiences

*The Custom Audiences Associated With the Ad Account.*

Description

Get The custom audiences associated with the ad account.
Usage

```
fbGetAdAccountCustomAudiences(
  business_ids = getOption("rfacebookstat.business_id"),
  accounts_id = getOption("rfacebookstat.accounts_id"),
  pixel_id = NULL,
  filtering = NULL,
  api_version = getOption("rfacebookstat.api_version"),
  username = getOption("rfacebookstat.username"),
  token_path = fbTokenPath(),
  access_token = getOption("rfacebookstat.access_token")
)
```

Arguments

- `business_ids`: Your business manager or project ID.
- `accounts_id`: Your account ID, for example 'act_11111111111111111'.
- `pixel_id`: This param fetches audiences associated to specific pixel.
- `filtering`: Filters on the report data. This parameter is an array of filter objects.
- `api_version`: Current Facebook API version.
- `username`: your username on Facebook
- `token_path`: path to dir with credentials
- `access_token`: Your facebook API token.

Value

data.frame with custom audiences data

Author(s)

Alexey Seleznev

---

**fbGetAdAccounts**

*Get avable ad account list.*

Description

`fbGetAdAccounts` get data frame with avable in your bussines manager ad account list in R.
Usage

```r
fbGetAdAccounts(source_id = getOption("rfacebookstat.business_id"),
                api_version = getOption("rfacebookstat.api_version"),
                username = getOption("rfacebookstat.username"),
                token_path = fbTokenPath(),
                access_token = getOption("rfacebookstat.access_token"))
```

Arguments

- **source_id**: Your business manager or project ID.
- **access_token**: Your Facebook API token.
- **username**: your username on Facebook
- **token_path**: path to dir with credentials
- **api_version**: Current Facebook API version.

Value

Data frame with ad account list.

Author(s)

Alexey Seleznev

Examples

```r
## Not run:
fbAccounts <- fbGetAdAccounts(source_id = "xxxxxxxxxxxxx",
                               api_version = "v2.10",
                               access_token = "xxxxxxxx")
```

```r
## End(Not run)
```

---

`fbGetAdAccountsConversions`

*Get list of custom conversion from ad accounts.*

Description

Custom conversions on Facebook allows you to optimize and track actions without having to add anything to your Facebook pixel base code. They also allow you to optimize for and track actions that are different from the 9 standard events that come with the Facebook pixel.
**fbGetAdAccountsConversions**

Usage

```r
fbGetAdAccountsConversions(
    accounts_id = getOption("rfacebookstat.accounts_id"),
    api_version = getOption("rfacebookstat.api_version"),
    username = getOption("rfacebookstat.username"),
    token_path = fbTokenPath(),
    access_token = getOption("rfacebookstat.access_token")
)
```

Arguments

- `accounts_id`: Your account ID, for example 'act_11111111111111111'.
- `access_token`: Your Facebook API token.
- `username`: Your username on Facebook.
- `token_path`: Path to dir with credentials.
- `api_version`: Current Facebook API version.

Value

Data frame with custom conversion list.

Author(s)

Alexey Seleznev

Examples

```r
## Not run:
conversions <- fbGetAdAccountsConversions()

## End(Not run)
```

---

**fbGetAdAccountUsers**

*Get User List From Account*

Description

`fbGetAdAccountUsers` get data frame with adaccounts user list in R.

Usage

```r
fbGetAdAccountUsers(
    accounts_id = getOption("rfacebookstat.accounts_id"),
    business_id = getOption("rfacebookstat.business_id"),
    api_version = getOption("rfacebookstat.api_version"),
    console_type = "progressbar",
    username = getOption("rfacebookstat.username"),
    token_path = fbTokenPath(),
    access_token = getOption("rfacebookstat.access_token")
)
```
Arguments

accounts_id  vector with ID of your ad account, for example `c("act_00001","act_00002")`.
business_id   ID by your Business Manager
access_token  Your facebook API token.
console_type  Console output type, "progressbar" or "message"
username      your username on Facebook
token_path    path to dir with credentials
api_version   Current Facebook API version.

Value

Data frame with ad account list.

Author(s)

Alexey Seleznev

Examples

```r
## Not run:
accountUsers <- fbGetAdAccountUsers(accounts_id = c("act_00001","act_00002"),
                                       bussiness_id = 1111111,
                                       access_token = "xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx")
## End(Not run)
```

Description

`fbGetAdAccountUsersPermissions` get ad account user list with him permissions. in R.

Usage

```r
fbGetAdAccountUsersPermissions(
    accounts_id = getOption("rfacebookstat.accounts_id"),
    api_version = getOption("rfacebookstat.api_version"),
    console_type = "progressbar",
    username = getOption("rfacebookstat.username"),
    token_path = fbTokenPath(),
    access_token = getOption("rfacebookstat.access_token"))
```
**fbGetAdCreative**

**Get creative list from Facebook marketing API**

**Description**

Get ads creatives list with parameters from Facebook marketing API. Format which provides layout and contains content for the ad.

**Usage**

```r
fbGetAdCreative(
  accounts_id = getOption("rfacebookstat.accounts_id"),
  filtering = NULL,
  api_version = getOption("rfacebookstat.api_version"),
  username = getOption("rfacebookstat.username"),
  token_path = fbTokenPath(),
  access_token = getOption("rfacebookstat.access_token"),
  limit = 50)
```

**Arguments**

- `accounts_id` vector with ID of your ad account, for example `c("act_00001","act_00002")`.
- `access_token` Your Facebook API token.
- `console_type` Console output type.
- `username` your username on Facebook.
- `token_path` path to dir with credentials.
- `api_version` Current Facebook API version.

**Value**

Data frame with ad account user permissions list.

**Author(s)**

Alexey Seleznev

**Examples**

```r
## Not run:
UP <- fbGetAdAccountUsersPermissions(accounts_id = c("act_00001","act_00002"),
                                       api_version = "v2.10",
                                       access_token = "xxxxxx")
## End(Not run)
```
Arguments
accounts_id    Your account ID, for example 'act_11111111111111'.
filtering      filter creatives
api_version    Current Facebook API version.
username       your username on Facebook
token_path     path to dir with credentials
access_token   Your facebook API token.
limit          Number of rows per API call

Value
Data frame with ads list.
1. id           The ID of this creative.
2. name         The name of the creative in the creative library.
3. status       The status of this creative.
4. url_tags      A set of query string parameters which will replace or be appended to urls
                 clicked from page post ads, message of the post, and canvas app install creatives only.
5. account_id   The ID of the ad account that this ad belongs to.
5. page_id      ID of a Facebook page. An unpublished page post will be created on this page.
                 User must have Admin or Editor role for this page.
5. link         Link url.
6. message      The main body of the post.
7. caption      Link caption.
8. attachment_style
                 The style of the attachment
9. description  Link description.
10. image_hash  Hash of an image in your image library with Facebook.

Author(s)
Alexey Seleznev

Examples
## Not run:
library(rfacebookstat)
fb_token <- fbGetToken(app_id = 0000000)
ads_creative <- fbGetAdCreative(accounts_id = "act_1111111111111111",
                                  api_version = 'v3.0',
                                  access_token = fb_token)

## End(Not run)
**fbGetAds**

Get ads list from facebook marketing API

---

**Description**

Get ads list with parameters from facebook marketing API. Contains information to display an ad and associate it an ad set. Each ad is associated with an ad set and all ads in a set have the same daily or lifetime budget, schedule, and targeting. Creating multiple ads in an ad set helps optimize their delivery based on variations in images, links, video, text or placements.

**Usage**

```r
fbGetAds(accounts_id = getOption("rfacebookstat.accounts_id"),
            api_version = getOption("rfacebookstat.api_version"),
            username = getOption("rfacebookstat.username"),
            token_path = fbTokenPath(),
            access_token = getOption("rfacebookstat.access_token"))
```

**Arguments**

- **accounts_id**: Your account ID, for example 'act_11111111111111111'.
- **api_version**: Current Facebook API version.
- **username**: your username on Facebook
- **token_path**: path to dir with credentials
- **access_token**: Your facebook API token.

**Value**

Data frame with ads list.

1. **id**: The ID of this ad.
2. **name**: Name of the ad.
3. **creative_id**: The ID or creative spec of the ad creative to be used by this ad.
4. **adset_id**: The ID of the ad set, required on creation.
5. **campaign_id**: ID of the ad campaign that contains this ad.
6. **account_id**: The ID of the ad account that this ad belongs to.
7. **bid_amount**: Bid amount for this ad which will be used in auction instead of the ad set bid_amount, if specified. Any updates to the ad set bid_amount will overwrite this value with the new ad set value.
8. **bid_type**: Bid type, one of CPC, CPM, MULTI_PREMIUM, ABSOLUTE_OCPM, CPA
9. **configured_status**: The configured status of the ad.
10. **effective_status**: The effective status of the ad. The status could be effective either because of its own status, or the status of its parent units.
Author(s)

Alexey Seleznev

Examples

```r
## Not run:
library(rfacebookstat)
fb_token <- fbGetToken(app_id = 0000000)
ads <- fbGetAds(accounts_id = "act_11111111111111111",
                   api_version = 'v3.0',
                   access_token = fb_token)
## End(Not run)
```

fbGetAdSets  Get creative list from facebook marketing API

Description

Get ads creatives list with parameters from facebook marketing API. An ad set is a group of ads that share the same daily or lifetime budget, schedule, bid type, bid info, and targeting data. Ad sets enable you to group ads according to your criteria, and you can retrieve the ad-related statistics that apply to a set.

Usage

```r
fbGetAdSets(accounts_id = getOption("rfacebookstat.accounts_id"),
             api_version = getOption("rfacebookstat.api_version"),
             username = getOption("rfacebookstat.username"),
             token_path = fbTokenPath(),
             access_token = getOption("rfacebookstat.access_token"))
```

Arguments

- `accounts_id`  Your account ID, for example ‘act_11111111111111111’.
- `api_version`  Current Facebook API version.
- `username`  your username on Facebook
- `token_path`  path to dir with credentials
- `access_token`  Your facebook API token.
**Value**

Data frame with ads list.

1. **id**  
   Ad set ID.

2. **name**  
   Name of ad set.

3. **account_id**  
   Ad Account ID.

4. **budget_remaining**  
   Remaining budget.

5. **configured_status**  
   The status set at the ad set level. It can be different from the effective status due to its parent campaign. Prefer using 'status' instead of this, one of ACTIVE, PAUSED, DELETED, ARCHIVED.

6. **effective_status**  
   The effective status of the ad set, which can be either its own status or caused by its parent campaign, one of ACTIVE, PAUSED, DELETED, PENDING_REVIEW, DISAPPROVED, PREAPPROVED, PENDING_BILLING_INFO, CAMPAIGN_PAUSED, ARCHIVED, ADSET_PAUSED.

7. **status**  
   The status set at the ad set level. It can be different from the effective status due to its parent campaign. The field returns the same value as ‘configured_status’, and is the suggested one to use (ACTIVE, PAUSED, DELETED, ARCHIVED).

8. **created_time**  
   Created time.

9. **bid_strategy**  
   Choose bid strategy for this ad set to suit your specific business goals. Each strategy has tradeoffs and may be available for certain optimization_goals:  
   - **LOWEST_COST_WITHOUT_CAP**: Designed to get the most results for your budget based on your ad set optimization_goal without limiting your bid amount. This is the best strategy if you care most about cost efficiency. However with this strategy it may be harder to get stable average costs as you spend. This strategy is also known as automatic bidding. Learn more in Ads Help Center, About bid strategies: Lowest cost.  
   - **LOWEST_COST_WITH_BID_CAP**: Designed to get the most results for your budget based on your ad set optimization_goal while limiting actual bid to your specified amount. With a bid cap you have more control over your cost per actual optimization event. However if you set a limit which is too low you may get less ads delivery. If you select this, you must provide a bid cap with the bid_amount field. Note: during creation this bid strategy is set if you provide bid_amount only. This strategy is also known as manual maximum-cost bidding. Learn more in Ads Help Center, About bid strategies: Lowest cost.  
   - **TARGET_COST**: Maintains a stable average cost based on your optimization_goal as you raise your ad set budget. Select this strategy if you care most about maintaining stable average costs for your ads. However, note that this strategy may be less cost-efficient than the lowest cost strategy. If you select this, you must provide a target cost with the bid_amount field. Target cost bid strategy is also known as manual average-cost bidding. Learn more in Ads Help Center, About bid strategies: Target cost. Note: If you enable campaign budget optimization, you should set bid_strategy at the parent campaign level.

10. **pacing_type**  
    Defines the pacing type, standard by default or using ad scheduling.
Author(s)
Alexey Seleznev

Examples

```r
## Not run:
library(rfacebookstat)
fb_token <- fbGetToken(app_id = 0000000)
adsets <- fbGetAdSets(accounts_id = "act_11111111111111111",
   api_version = 'v3.0',
   access_token = fb_token)
## End(Not run)
```

---

**fbGetAdVideos**

*Get videos list from ad accounts*

Description

Load all videos from Facebook ad accounts.

Usage

```r
fbGetAdVideos(accounts_id = getOption("rfacebookstat.accounts_id"),
   api_version = getOption("rfacebookstat.api_version"),
   username = getOption("rfacebookstat.username"),
   token_path = fbTokenPath(),
   access_token = getOption("rfacebookstat.access_token"))
```

Arguments

- `accounts_id`  Your account ID, for example 'act_11111111111111111'.
- `api_version`  Current Facebook API version.
- `username`  Your username on Facebook
- `token_path`  Path to dir with credentials
- `access_token`  Your facebook API token.

Value

Data frame with video parameters list.

Author(s)
Alexey Seleznev
fbGetApps

Examples

## Not run:
ads <- fbGetAdVideos()

## End(Not run)

---

fbGetApps

Get all the apps under a project

Description

Get data frame with list apps under a project.

Usage

```r
fbGetApps(accounts_id = getOption("rfacebookstat.accounts_id"),
            api_version = getOption("rfacebookstat.api_version"),
            username = getOption("rfacebookstat.username"),
            token_path = fbTokenPath(),
            access_token = getOption("rfacebookstat.access_token"))
```

Arguments

- `accounts_id`: Facebook Ad Account ID.
- `api_version`: Current Facebook API version.
- `username`: Your username on Facebook.
- `token_path`: path to dir with credentials.
- `access_token`: Your facebook API token.

Value

Data frame with apps list.

Author(s)

Alexey Seleznev

Examples

## Not run:
```r
accounts <- fbGetAccounts()
fbApps <- fbGetApps(accounts$id)

## End(Not run)
```
fbGetBusinessManagers  Get available business Managers.

Description

fbGetBusinessManagers get data frame with available business managers list in R.

Usage

```r
fbGetBusinessManagers(api_version = getOption("rfacebookstat.api_version"),
                       username = getOption("rfacebookstat.username"),
                       token_path = fbTokenPath(),
                       access_token = getOption("rfacebookstat.access_token"))
```

Arguments

- `access_token`: Your Facebook API token.
- `username`: your username on Facebook
- `token_path`: path to dir with credentials
- `api_version`: Current Facebook API version.

Value

Data frame with ad account list.

Author(s)

Alexey Seleznev

Examples

```r
## Not run:
BM <- fbGetBusinessManagers(api_version = "v2.10", access_token = "xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx")

## End(Not run)
```
fbGetBusinessManagersUsers

Get a list of business manager users

Description

Loading user list from business managers.

Usage

```r
fbGetBusinessManagersUsers(
    business_ids = getOption("rfacebookstat.business_id"),
    user_types = c('business_users',
                   'system_users',
                   'pending_users'),
    api_version = getOption("rfacebookstat.api_version"),
    username = getOption("rfacebookstat.username"),
    token_path = fbTokenPath(),
    access_token = getOption("rfacebookstat.access_token"))
```

Arguments

- **business_ids**: IDs by your Business Manager
- **user_types**: user types: business_users, system_users, pending_users.
- **username**: your username on Facebook
- **token_path**: path to dir with credentials
- **access_token**: Your facebook API token.
- **api_version**: Current Facebook API version.

Value

Data frame with business managers user list.

Author(s)

Alexey Seleznev

Examples

```r
## Not run:
options(rfacebookstat.business_id = 000000000000)

bm_users <- fbGetBusinessManagersUsers()

## End(Not run)
```
fbGetBusinessUserAdAccounts

*Get a list of accounts for a business manager user*

**Description**

Loading account list for business manager user.

**Usage**

```r
fbGetBusinessUserAdAccounts(
    business_users_id = NULL,
    business_id = getOption("rfacebookstat.business_id"),
    api_version = getOption("rfacebookstat.api_version"),
    username = getOption("rfacebookstat.username"),
    token_path = fbTokenPath(),
    access_token = getOption("rfacebookstat.access_token"))
```

**Arguments**

- `business_users_id`: ID by business manager user.
- `business_id`: ID by your Business Manager.
- `username`: your username on Facebook.
- `token_path`: path to dir with credentials.
- `access_token`: Your facebook API token.
- `api_version`: Current Facebook API version.

**Value**

Data frame with ad account list.

**Author(s)**

Alexey Seleznev

**Examples**

```r
## Not run:
options(rfacebookstat.business_id = 000000000000,
        rfacebookstat.access_token = "abcde12345....")

my_accs <- fbGetBusinessUserAdAccounts(
    business_users_id = 777423445991332
)

## End(Not run)
```

**fbGetCampaigns**  

*Get campaign list from facebook marketing API*

---

**Description**

Get campaign list with parameters from facebook marketing API.

**Usage**

```r
fbGetCampaigns(accounts_id = getOption("rfacebookstat.accounts_id"),
                api_version = getOption("rfacebookstat.api_version"),
                username = getOption("rfacebookstat.username"),
                token_path = fbTokenPath(),
                access_token = getOption("rfacebookstat.access_token"))
```

**Arguments**

- **accounts_id**: Your account ID, for example 'act_11111111111111111'.
- **api_version**: Current Facebook API version.
- **username**: your username on Facebook
- **token_path**: path to dir with credentials
- **access_token**: Your facebook API token.

**Value**

Data frame with campaign list.

**Author(s)**

Alexey Seleznev

**Examples**

```r
## Not run:
library(rfacebookstat)
fb_token <- fbGetToken(app_id = 0000000)
camp <- fbGetCampaigns(accounts_id = "act_11111111111111111",
                        api_version = 'v3.0',
                        access_token = fb_token)

## End(Not run)
```
**fbGetCatalogs**

*Get catalogs*

**Description**

Load catalogs from business manager.

**Usage**

```r
fbGetCatalogs(business_id = getOption("rfacebookstat.business_id"),
              api_version = getOption("rfacebookstat.api_version"),
              username = getOption("rfacebookstat.username"),
              token_path = fbTokenPath(),
              access_token = getOption("rfacebookstat.access_token"))
```

**Arguments**

- `business_id`: ID by your Business Manager
- `api_version`: Current Facebook API version.
- `username`: your username on Facebook
- `token_path`: path to dir with credentials
- `access_token`: Your API facebook token

**Value**

Data frame with project list

**Author(s)**

Alexey Seleznev

**Examples**

```r
## Not run:
bc <- fbGetCatalogs(business_id = 1111111111,
                     access_token = "xxxxxxxx")

## End(Not run)
```
fbGetCostData

Get facebook ads cost data.

Description

Get cost data for loading it into Google Analytics

Usage

```r
fbGetCostData(
  accounts_id = getOption("rfacebookstat.accounts_id"),
  date_start = Sys.Date() - 30,
  date_stop = Sys.Date(),
  utm_source = "facebook",
  utm_medium = "cpc",
  username = getOption("rfacebookstat.username"),
  token_path = fbTokenPath(),
  access_token = getOption("rfacebookstat.access_token"))
```

Arguments

- `accounts_id`: ID of your ad account.
- `date_start`: Start reporting date.
- `date_stop`: End reporting day
- `utm_source`: UTM source name for Google Analytics.
- `utm_medium`: UTM medium name for Google Analytics.
- `username`: your username on Facebook
- `token_path`: path to dir with credentials
- `access_token`: Your facebook API token

Details

Before loading data create data source at Google Analytics.

Value

Data frame with statistic.

Author(s)

Alexey Seleznev

Google Analytics: Understand Data Sets
Examples

## Not run:

```r
# Use googleAnalyticsR for upload data into Google Analytics
library(googleAnalyticsR)

# load cost data
cost_data <- fbGetCostData(accounts_id = "act_11111",
                           date_start = "2020-05-10",
                           date_stop = "2020-05-14",
                           username = "fb_login")

# upload into GA source
ga_custom_upload_file(accountId = xxxx,
                      webPropertyId = "UA-xxxx-1",
                      customDataSourceId = \"abcdefg\",
                      cost_data)
```

## End(Not run)

---

fbGetLogins  

*Get all authorization logins*

Description

Get all your authorized facebook logins

Usage

```r
fbGetLogins(
    token_path = fbTokenPath(),
    set_login = TRUE)
```

Arguments

- **token_path**  
  path to dir with credentials
- **set_login**  
  if TRUE you can choise and change current session login

Author(s)

Alexey Seleznev

Examples

## Not run:

```r
fbGetLogins()
```

## End(Not run)
fbGetLongTimeToken

Get API facebook long time token.

Description

Change your short time token to long time token.

Usage

fbGetLongTimeToken(client_id=NULL, client_secret=NULL, fb_exchange_token=NULL)

Arguments

client_id Your App ID.
client_secret Your App secret.
fb_exchange_token Your short time API token.

Value

API token

Author(s)

Alexey Seleznev

fbGetMarketingStat

Get statistic by ad accounts.

Description

fbGetMarketingStat is main function of rfacebookstat package, intended for load statistic data by your ad, adset, campaign or account.

Usage

fbGetMarketingStat(
    accounts_id = getOption("rfacebookstat.accounts_id"),
    sorting = NULL, level = "account", breakdowns = NULL,
    action_breakdowns = NULL,
    fields = "account_id,campaign_name,impressions,clicks,reach,spend",
    filtering = NULL, date_start = NULL,
    date_stop = NULL, date_preset = "last_30d",
    attribution_window = NULL,
    api_version = getOption("rfacebookstat.api_version"),
)
```r
fbGetMarketingStat

action_report_time = NULL, interval = "day",
use_account_attribution_setting = FALSE,
console_type = "progressbar", request_speed = "normal",
fetch_by = NULL,
username = getOption("rfacebookstat.username"),
token_path = fbTokenPath(),
access_token = getOption("rfacebookstat.access_token")

Arguments

accounts_id  ID of your ad account.
sorting  Field to sort the result, and direction of sorting. You can specify sorting direction by appending ":ascending" or ":descending" to the sort field. For example, "reach_descending". This array supports no more than one element. By default, the sorting direction is ascending.
level  Represents the level of result. Available: ad, adset, campaign, account.
action_breakdowns  Group results in the actions field. You can use the following breakdowns for action_breakdowns, for details go, or see details
breakdowns  Permutations marked with an asterisk (*) can be joined with action_type and action_target_id. Available: age, country, gender, frequency_value, hourly_stats_aggregated_by_advertiser_time_zone, hourly_stats_aggregated_by_audience_time_zone, impression_device, place_page_id, placement, device_platform, product_id, region. See details.
fields  List of fields which you want get in R. You can find list of available fields at Facebook API documentation by this link.
filtering  Vector of filtering or JSON string with array of filtering parameters, for example 
"ad.effective_status IN ARCHIVED" 
see filtering block for more examples
date_start  Start reporting date.
date_stop  End reporting day
date_preset  Represents a relative time range. This field is ignored if time_range or time_ranges is specified. One of: today, yesterday, this_month, last_month, this_quarter, lifetime, last_3d, last_7d, last_14d, last_28d, last_30d, last_90d, last_week_mon_sun, last_week_sun_sat, last_quarter, last_year, this_week_mon_today, this_week_sun_today, this_year

attribution_window  The conversion attribution window provides timeframes that define when we attribute an event to an ad on Facebook. See Attribution Window sections.
request_speed  Speed between API request, "normal", "fast" or "slow", depend of you API access level.
fetch_by  Character, split your request by time interval, one of: day, week, month, quarter, year.
api_version  Current Facebook API version.
action_report_time  Determines the report time of action stats.
```
interval Character value for split by time interval, one of "day", "week", "month", "quarter", "year". By default = "day"

use_account_attribution_setting When this parameter is set to true, your ads results will be shown using the attribution settings defined for the ad account.

console_type Character value for manage console output message, one of "progressbar", "message". By default = "progressbar". See more at Detail

username your username on Facebook

token_path path to dir with credentials

access_token Your facebook API token

Details

Console_type parameters, if chose "progressbar" you can see load progress in percent, and if chose "message" you get message about loading process.

Value

Data frame with statistic.

Breakdowns

Allowed values for breakdowns.

• ad_format_asset
• age
• body_asset
• call_to_action_asset
• country
• description_asset
• gender
• image_asset
• impression_device
• link_url_asset
• product_id
• region
• title_asset
• video_asset
• dma
• frequency_value
• hourly_stats_aggregated_byAdvertiser_time_zone
• hourly_stats_aggregated_by_audience_time_zone
- place_page_id
- publisher_platform
- platform_position
- device_platform

**Action Breakdowns**

Group results in the actions field. You can use the following breakdowns for action_breakdowns. Now you can use next action breakdowns:

- **action_device** The device on which the conversion event you’re tracking occurred. For example, "Desktop" if someone converted on a desktop computer.
- **action_destination** The destination where people go after clicking on your ad. This could be your Facebook Page, an external URL for your conversion pixel or an app configured with the software development kit (SDK).
- **action_reaction** The number of reactions on your ads or boosted posts. The reactions button on an ad allows people to share different reactions on its content: Like, Love, Haha, Wow, Sad or Angry.
- **action_target_id** The id of destination where people go after clicking on your ad. This could be your Facebook Page, an external URL for your conversion pixel or an app configured with the software development kit (SDK).
- **action_type** The kind of actions taken on your ad, Page, app or event after your ad was served to someone, even if they didn’t click on it. Action types include Page likes, app installs, conversions, event responses and more.
- **action_type, action_reaction** Together of action types and reactions breakdown.

**Available Combinations Of Breakdowns**

Grouping types marked with an asterisk (*) can be combined with action_type, action_target_id, and action_destination (action_target_id).

- action_type *
- action_target_id *
- action_device *
- action_device, impression_device *
- action_device, publisher_platform *
- action_device, publisher_platform, impression_device *
- action_device, publisher_platform, platform_position *
- action_device, publisher_platform, platform_position, impression_device *
- action_reaction
- action_type, action_reaction
- age *
- gender *
• age, gender *
• country *
• region *
• publisher_platform *
• publisher_platform, impression_device *
• publisher_platform, platform_position *
• publisher_platform, platform_position, impression_device *
• product_id *

**Attribution Window**

The conversion attribution window provides time intervals that determine the attribution period of an event for advertising on Facebook. For background information, see Facebook Ads Help Center, How Attribution Reporting Works. We measure the actions that occur when a conversion event occurs and look back in time 1-day, 7-days, and 28 days. To view actions attributed to different attribution windows, use `attribution_window`.

**account_default** Use the account level attribution window setting

**default** The FB default attribution window is 1 day views, 28 day clicks

**inline** Inline attribution only (0 day views, 0 day clicks)

- **1d_view** 1 day views, 0 day clicks
- **7d_view** 7 day views, 0 day clicks
- **28d_view** 28 day views, 0 day clicks
- **1d_click** 0 day views, 1 day clicks
- **7d_click** 0 day views, 7 day clicks
- **28d_click** 0 day views, 28 day clicks
- **1d_view_1d_click** 1 day views, 1 day clicks
- **7d_view_1d_click** 7 day views, 1 day clicks
- **28d_view_1d_click** 28 day views, 1 day clicks
- **1d_view_7d_click** 1 day views, 7 day clicks
- **1d_view_28d_click** 1 day views, 28 day clicks
- **28d_view_28d_click** 28 day views, 28 day clicks

Also you can get more than one attribution window in one request, for example `attribution_window = c('default','1d_view','28d_view','28d_click')`

**Filtering**

Filters on the report data. This parameter is an array of filter objects. You can set string vector or JSON string with field, operator and value.

**field** Field for filtering.
operator  One of EQUAL, NOT_EQUAL, GREATER_THAN, GREATER_THAN_OR_EQUAL, 
            LESS_THAN, LESS_THAN_OR_EQUAL, IN_RANGE, NOT_IN_RANGE, CONTAIN, NOT_CONTAIN, 
            IN, NOT_IN, STARTS_WITH, ANY, ALL, AFTER, BEFORE, NONE.

value  Field value for filtering.

Simple filtering:

Example vector  filtering = "publisher_platform IN instagram"

Example JSON filtering = "[{'field': 'publisher_platform', 'operator': 'IN', 'value': ['instagram']}]

Example of using two or more conditions: filtering = "[{'field': 'clicks', 'operator': 'LESS_THAN', 'value': 500},
                                                       {'field': 'impressions', 'operator': 'GREATER_THAN', 'value': 20000}]

Filtering by two or more conditions:

Example vector  filtering = c("clicks LESS_THAN 500","impressions GREATER_THAN 20000")

Example JSON filtering = "[{'field': 'clicks', 'operator': 'LESS_THAN', 'value': 500},
                                                       {'field': 'impressions', 'operator': 'GREATER_THAN', 'value': 20000}]

Filtering with operators IN_RANGE, NOT_IN_RANGE, IN, NOT_IN

Example vector  filtering = 'publisher_platform IN instagram,facebook'

Example JSON filtering = "[{'field': 'publisher_platform', 'operator': 'IN', 'value': ['instagram', 'facebook']}]

about breakdowns and action breakdowns on this link. More information about action field in this 
documentation.

Examples

## Not run:
fbStat <- fbGetMarketingStat(accounts_id = "actxxxxxxxxxxxxxxx",
                             level = "campaign",
                             fields = "account_name,campaign_name,impressions",
                             breakdowns = "device_platform",
                             date_start = "2016-08-01",
                             date_stop = "2016-08-10",
                             interval = "day",
                             access_token = "xxxxxxxxxxxxxxxxxxxxxxxxxxxxx")

## End(Not run)
fbGetPages

Get pages list

Description
Load data about all available pages

Usage

```r
fbGetPages(accounts_id = getOption("rfacebookstat.accounts_id"),
            api_version = getOption("rfacebookstat.api_version"),
            username = getOption("rfacebookstat.username"),
            token_path = fbTokenPath(),
            access_token = getOption("rfacebookstat.access_token"))
```

Arguments

- `accounts_id`: Facebook Ad Account ID.
- `api_version`: Current Facebook API version.
- `username`: your username on Facebook
- `token_path`: path to dir with credentials
- `access_token`: Your facebook API token.

Value

Data frame with pages list

Author(s)

Alexey Seleznev

Examples

```r
## Not run:
accounts <- fbGetAccounts()
fbPages <- fbGetPages(accounts$id)

## End(Not run)
```
**fbGetSettings**  
*Get settings.*

**Description**
Get settings of rfacebookstat package.

**Usage**
```r
defbGetSettings()
```

**Author(s)**
Alexey Seleznev

**Examples**
```r
## Not run:
fbGetSettings()
## End(Not run)
```

---

**fbGetToken**  
*Get API facebook token.*

**Description**
Get API facebook token for access to facebook ads API.

**Usage**
```r
fbGetToken(app_id = NULL)
```

**Arguments**

<table>
<thead>
<tr>
<th>app_id</th>
<th>ID of your Facebook App</th>
</tr>
</thead>
</table>

**Value**
API token

**Author(s)**
Alexey Seleznev
Examples

```r
## Not run:
tkn <- fbGetToken()

## End(Not run)
```

### Description

The advertising accounts to which this person has access.

### Usage

```r
fbGetUserAdAccounts(user_id = "me",
                    api_version = getOption("rfacebookstat.api_version"),
                    username = getOption("rfacebookstat.username"),
                    token_path = fbTokenPath(),
                    access_token = getOption("rfacebookstat.access_token"))
```

#### Arguments

- `user_id`  
  Facebook user id.
- `access_token`  
  Your facebook API token.
- `username`  
  your username on Facebook
- `token_path`  
  path to dir with credentials
- `api_version`  
  Current Facebook API version.

### Value

Data frame with ad account list.

### Author(s)

Alexey Selezev

### Examples

```r
## Not run:
fbAccounts <- fbGetUserAdAccounts()

## End(Not run)
```
**fbSetters**  
*Set rfacebookstat options*

---

**Description**

Set rfacebookstat options in current R session

**Usage**

- `fbSetUsername(username)`
- `fbSetAccount(accounts_ids)`
- `fbSetBusinessId(business_ids)`
- `fbSetTokenPath(token_path)`
- `fbSetApiVersion(api_version)`

**Arguments**

- `accounts_ids`  
  Facebook Ad Account ID.
- `business_ids`  
  IDs by your Business Manager
- `username`  
  your username on Facebook
- `token_path`  
  path to dir with credentials
- `api_version`  
  Current Facebook API version.

**Author(s)**

Alexey Seleznev

---

**fbUpdateAdAccountUsers**

*Add users and update permission list.*

---

**Description**

`fbUpdateAdAccountUsers` add users and update permission list for users in ad accounts at facebook.

**Usage**

```r
fbUpdateAdAccountUsers(
  user_ids = NULL,
  role = "advertiser",
  accounts_id =getOption("rfacebookstat.accounts_id"),
  api_version =getOption("rfacebookstat.api_version"),
  username =getOption("rfacebookstat.username"),
  token_path = fbTokenPath(),
  access_token =getOption("rfacebookstat.access_token")
)
```
Arguments

accounts_id  vector with ID of your ad account, for example c("act_00001","act_00002").
role  Character or integer value, one of administrator, advertiser, ad manager, analyst, sales, direct sales, 1001, 1002, 1003, 1004 (https://developers.facebook.com/docs/marketing-api/aduser/v2.12).
access_token  Your facebook API token.
user_ids  vector with users ids who need remove from ad account.
username  your username on Facebook
token_path  path to dir with credentials
api_version  Current Facebook API version.

Details

Requires: ads_management permission is required. You need 'Administrator' access to the ad account to remove users

Roles: 1001 = Administrator access 1002 = Advertiser, or ad manager, access 1003 = Analyst access 1004 = Direct sales access. For limited, directly managed accounts.

Permissions: 1: ACCOUNT_ADMIN: modify list of people associated with the account. 2: ADMANAGER_READ: view campaigns and ads 3: ADMANAGER_WRITE: manage campaigns and ads 4: BILLING_READ: view account billing information 5: BILLING_WRITE: modify account billing information 7: REPORTS: run reports 9, 10 - Apply to some directly managed accounts. Not currently needed for Marketing API calls

For more details go link (https://developers.facebook.com/docs/marketing-api/aduser/)
