

Package ‘sigminer’

November 11, 2020

Title Extract, Analyze and Visualize Mutational Signatures for Genomic Variations

Version 1.1.0

Description Genomic alterations including single nucleotide substitution, copy number alteration, etc. are the major force for cancer initialization and development. Due to the specificity of molecular lesions caused by genomic alterations, we can generate characteristic alteration spectra, called 'signature' (Wang, Shixiang, et al. (2020) <DOI:10.1101/2020.04.27.20082404> & Alexandrov, Ludmil B., et al. (2020) <DOI:10.1038/s41586-020-1943-3> & Macintyre, Geoff, et al. (2018) <DOI:10.1038/s41588-018-0179-8>). This package helps users to extract, analyze and visualize signatures from genomic alteration records, thus providing new insight into cancer study.

add_h_arrow	<i>Add Horizontal Arrow with Text Label to a ggplot</i>
-------------	---

Description

Add Horizontal Arrow with Text Label to a ggplot

Usage

```
add_h_arrow(
  p,
  x,
  y,
  label = "optimal number",
  space = 0.01,
  vjust = 0.3,
  seg_len = 0.1,
  arrow_len = unit(2, "mm"),
  arrow_type = c("closed", "open"),
  font_size = 5,
  font_family = c("serif", "sans", "mono"),
  font_face = c("plain", "bold", "italic")
)
```

Arguments

p	a ggplot.
x	position at x axis.
y	position at y axis.
label	text label.
space	a small space between arrow and text.
vjust	vertical adjustment, set to 0 to align with the bottom, 0.5 for the middle, and 1 (the default) for the top.
seg_len	length of the arrow segment.
arrow_len	length of the arrow.

arrow_type	type of the arrow.
font_size	font size.
font_family	font family.
font_face	font face.

Value

a ggplot object.

add_labels	<i>Add Text Labels to a ggplot</i>
------------	------------------------------------

Description

Add text labels to a ggplot object, such as the result from [show_sig_profile](#).

Usage

```
add_labels(
  p,
  x,
  y,
  y_end = NULL,
  n_label = NULL,
  labels = NULL,
  revert_order = FALSE,
  font_size = 5,
  font_family = "serif",
  font_face = c("plain", "bold", "italic"),
  ...
)
```

Arguments

p	a ggplot.
x	position at x axis.
y	position at y axis.
y_end	end position of y axis when n_label is set.
n_label	the number of label, when this is set, the position of labels at y axis is auto-generated according to y and y_end.
labels	text labels or a similarity object from get_sig_similarity .
revert_order	if TRUE, revert label order.
font_size	font size.
font_family	font family.
font_face	font face.
...	other parameters passing to ggplot2::annotate .

Value

a ggplot object.

Examples

```
# Load mutational signature
load(system.file("extdata", "toy_mutational_signature.RData",
  package = "sigminer", mustWork = TRUE
))
# Show signature profile
p <- show_sig_profile(sig2, mode = "SBS")

# Method 1
p1 <- add_labels(p,
  x = 0.75, y = 0.3, y_end = 0.9, n_label = 3,
  labels = paste0("text", 1:3)
)
p1

# Method 2
p2 <- add_labels(p,
  x = c(0.15, 0.6, 0.75), y = c(0.3, 0.6, 0.9),
  labels = paste0("text", 1:3)
)
p2

# Method 3
sim <- get_sig_similarity(sig2)
p3 <- add_labels(p,
  x = c(0.15, 0.6, 0.75), y = c(0.25, 0.55, 0.8),
  labels = sim, font_size = 2
)
p3
```

centromeres.hg19

Location of Centromeres at Genome Build hg19

Description

Location of Centromeres at Genome Build hg19

Format

A data.frame

Source

Generate from UCSC gold path

Examples

```
data(centromeres.hg19)
```

centromeres.hg38	<i>Location of Centromeres at Genome Build hg38</i>
------------------	---

Description

Location of Centromeres at Genome Build hg38

Format

A data.frame

Source

Generate from Genome Reference Consortium

Examples

```
data(centromeres.hg38)
```

centromeres.mm10	<i>Location of Centromeres at Genome Build mm10</i>
------------------	---

Description

Location of Centromeres at Genome Build mm10

Format

A data.frame

Source

Generate from <https://hgdownload.soe.ucsc.edu/goldenPath/mm10/database/gap.txt.gz>

Examples

```
data(centromeres.mm10)
```

`chromsize.hg19`*Chromosome Size of Genome Build hg19*

Description

Chromosome Size of Genome Build hg19

Format

A data.frame

Source

Generate from UCSC gold path

Examples

```
data(chromsize.hg19)
```

`chromsize.hg38`*Chromosome Size of Genome Build hg38*

Description

Chromosome Size of Genome Build hg38

Format

A data.frame

Source

Generate from UCSC gold path

Examples

```
data(chromsize.hg38)
```

chromsize.mm10	<i>Chromosome Size of Genome Build mm10</i>
----------------	---

Description

Chromosome Size of Genome Build mm10

Format

A data.frame

Source

Generate from UCSC gold path <http://hgdownload.cse.ucsc.edu/goldenPath/mm10/bigZips/mm10.chrom.sizes>

Examples

```
data(chromsize.mm10)
```

CN.features	<i>Classification Table of Copy Number Features Devised by Wang et al. for Method 'W'</i>
-------------	---

Description

Classification Table of Copy Number Features Devised by Wang et al. for Method 'W'

Format

A data.table with "sigminer.features" class name

Source

Generate from code under data_raw/

Examples

```
data(CN.features)
```

CopyNumber-class *Class CopyNumber*

Description

S4 class for storing summarized absolute copy number profile.

Slots

data data.table of absolute copy number calling.

summary.per.sample data.table of copy number variation summary per sample.

genome_build genome build version, should be one of 'hg19' or 'hg38'.

genome_measure Set 'called' will use autosomo called segments size to compute total size for CNA burden calculation, this option is useful for WES and target sequencing. Set 'wg' will autosome size from genome build, this option is useful for WGS, SNP etc..

annotation data.table of annotation for copy number segments.

dropoff.segs data.table of copy number segments dropped from raw input.

cosine *Calculate Cosine Measures*

Description

Calculate Cosine Measures

Usage

```
cosine(x, y)
```

Arguments

x a numeric vector or matrix.

y must be same format as x.

Value

a numeric value or matrix.

Examples

```
x <- c(1, 1, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0)
y <- c(0, 0, 1, 1, 1, 1, 1, 0, 1, 0, 0, 0)
z1 <- cosine(x, y)
z1
z2 <- cosine(matrix(x), matrix(y))
z2
```

cytobands.hg19

Location of Chromosome Cytobands at Genome Build hg19

Description

Location of Chromosome Cytobands at Genome Build hg19

Format

A data.frame

Source

from UCSC

Examples

```
data(cytobands.hg19)
```

cytobands.hg38

Location of Chromosome Cytobands at Genome Build hg38

Description

Location of Chromosome Cytobands at Genome Build hg38

Format

A data.frame

Source

from UCSC

Examples

```
data(cytobands.hg38)
```

`cytobands.mm10`*Location of Chromosome Cytobands at Genome Build mm10*

Description

Location of Chromosome Cytobands at Genome Build mm10

Format

A data.frame

Source

from UCSC <http://hgdownload.cse.ucsc.edu/goldenpath/mm10/database/cytoBand.txt.gz>

Examples

```
data(cytobands.mm10)
```

`enrich_component_strand_bias`*Performs Strand Bias Enrichment Analysis for a Given Sample-by-Component Matrix*

Description

See [sig_tally](#) for examples.

Usage

```
enrich_component_strand_bias(mat)
```

Arguments

`mat` a sample-by-component matrix from [sig_tally](#) with strand bias labels "T:" and "B:".

Value

a data.table sorted by p_value.

get_adj_p

*Get Adjust P Values from Group Comparison***Description**

Setting `aes(label=..p.adj..)` in `ggpubr::compare_means()` does not show adjust p values. The returned result of this function can be combined with `ggpubr::stat_pvalue_manual()` to fix this problem.

Usage

```
get_adj_p(
  data,
  .col,
  .grp = "Sample",
  comparisons = NULL,
  method = "wilcox.test",
  p.adjust.method = "fdr",
  p.digits = 3L,
  ...
)
```

Arguments

<code>data</code>	a data.frame containing column for groups and column for comparison.
<code>.col</code>	column name for comparison.
<code>.grp</code>	column name for groups.
<code>comparisons</code>	Default is NULL, use all combination in group column. It can be a list of length-2 vectors. The entries in the vector are either the names of 2 values on the x-axis or the 2 integers that correspond to the index of the groups of interest, to be compared.
<code>method</code>	a character string indicating which method to be used for comparing means. It can be 't.test', 'wilcox.test' etc..
<code>p.adjust.method</code>	correction method, default is 'fdr'. Run <code>p.adjust.methods</code> to see all available options.
<code>p.digits</code>	how many significant digits are to be used.
<code>...</code>	other arguments passed to <code>ggpubr::compare_means()</code>

Details

More info see `ggpubr::compare_means()`, `ggpubr::stat_compare_means()` and `stats::p.adjust()`.

Value

a data.frame containing comparison result

Source

<https://github.com/kassambara/ggpubr/issues/143>

Examples

```
library(ggpubr)
# T-test
stat.test <- compare_means(
  len ~ dose,
  data = ToothGrowth,
  method = "t.test",
  p.adjust.method = "fdr"
)
stat.test
# Create a simple box plot
p <- ggboxplot(ToothGrowth, x = "dose", y = "len")
p

# Add p values
my_comparisons <- list(c("0.5", "1"), c("1", "2"), c("0.5", "2"))
p + stat_compare_means(method = "t.test", comparisons = my_comparisons)

# Try adding adjust p values
# proposed by author of ggpubr
# however it does not work
p + stat_compare_means(aes(label = ..p.adj..), method = "t.test", comparisons = my_comparisons)

# Solution:
# calculate adjust p values and their location
# then use stat_pvalue_manual() function
p_adj <- get_adj_p(ToothGrowth, .col = "len", .grp = "dose")
p_adj
p + stat_pvalue_manual(p_adj, label = "p.adj")

# Show selected comparisons
# Of note, p value is adjusted
# for three comparisons, but only
# two are showed in figure
p_adj <- get_adj_p(ToothGrowth,
  .col = "len", .grp = "dose",
  comparisons = list(c("0.5", "1"), c("1", "2"))
)
p + stat_pvalue_manual(p_adj, label = "p.adj")
```

get_bayesian_result *Get Specified Bayesian NMF Result from Run*

Description

Sometimes, we may want to use or inspect specified run result from [sig_auto_extract](#). This function is designed for this purpose.

Usage

```
get_bayesian_result(run_info)
```

Arguments

run_info a data.frame with 1 row and two necessary columns Run and file.

Value

a list.

Author(s)

Shixiang Wang

Examples

```
load(system.file("extdata", "toy_copynumber_tally_W.RData",
  package = "sigminer", mustWork = TRUE
))

res <- sig_auto_extract(cn_tally_W$nmf_matrix, result_prefix = "Test_copynumber", nrun = 1)

# All run info are stored in res$Raw$summary_run
# Obtain result of run 1
res_run1 <- get_bayesian_result(res$Raw$summary_run[1, ])
```

get_cn_freq_table *Get CNV Frequency Table*

Description

Get CNV Frequency Table

Usage

```
get_cn_freq_table(
  data,
  genome_build = "hg19",
  cutoff = 2L,
  resolution_factor = 1L
)
```

Arguments

data	a CopyNumber object or a data.frame containing at least 'chromosome', 'start', 'end', 'segVal', 'sample' these columns.
genome_build	genome build version, used when data is a data.frame, should be 'hg19' or 'hg38'.
cutoff	copy number value cutoff for splitting data into AMP and DEL. The values equal to cutoff are discarded. Default is 2, you can also set a length-2 vector, e.g. c(2, 2).
resolution_factor	an integer to control the resolution. When it is 1 (default), compute frequency in each cytoband. When it is 2, use compute frequency in each half cytoband.

Value

a data.table.

get_cn_ploidy	<i>Get Ploidy from Absolute Copy Number Profile</i>
---------------	---

Description

Get Ploidy from Absolute Copy Number Profile

Usage

```
get_cn_ploidy(data)
```

Arguments

data	a CopyNumber object or a data.frame containing at least 'chromosome', 'start', 'end', 'segVal' these columns.
------	---

Value

a value or a data.table

Examples

```
# Load copy number object
load(system.file("extdata", "toy_copynumber.RData",
  package = "sigminer", mustWork = TRUE
))

df <- get_cn_ploidy(cn)
df
```

get_genome_annotation *Get Genome Annotation*

Description

Get Genome Annotation

Usage

```
get_genome_annotation(  
  data_type = c("chr_size", "centro_loc", "cytobands", "transcript"),  
  chrs = paste0("chr", c(1:22, "X", "Y")),  
  genome_build = c("hg19", "hg38", "mm10")  
)
```

Arguments

`data_type` 'chr_size' for chromosome size, 'centro_loc' for location of centromeres, 'cytobands' for location of chromosome cytobands and 'transcript' for location of transcripts.

`chrs` chromosomes start with 'chr'

`genome_build` one of 'hg19', 'hg38'

Value

a `data.frame` containing annotation data

Examples

```
df1 <- get_genome_annotation()  
df1  
  
df2 <- get_genome_annotation(genome_build = "hg38")  
df2  
  
df3 <- get_genome_annotation(data_type = "centro_loc")  
df3  
  
df4 <- get_genome_annotation(data_type = "centro_loc", genome_build = "hg38")  
df4  
  
df5 <- get_genome_annotation(data_type = "cytobands")  
df5  
  
df6 <- get_genome_annotation(data_type = "cytobands", genome_build = "hg38")  
df6
```

get_groups

Get Sample Groups from Signature Decomposition Information

Description

One of key results from signature analysis is to cluster samples into different groups. This function takes Signature object as input and return the membership in each cluster.

Usage

```
get_groups(
  Signature,
  method = c("consensus", "k-means", "exposure", "samples"),
  n_cluster = NULL,
  match_consensus = TRUE
)
```

Arguments

Signature	a Signature object obtained either from sig_extract or sig_auto_extract . Now it can be used to relative exposure result in data.table format from sig_fit .
method	grouping method, more see details, could be one of the following: <ul style="list-style-type: none"> • 'consensus' - returns the cluster membership based on the hierarchical clustering of the consensus matrix, it can only be used for the result obtained by sig_extract() with multiple runs using NMF package. • 'k-means' - returns the clusters by k-means. • 'exposure' - assigns a sample into a group whose signature exposure is dominant. • 'samples' - returns the cluster membership based on the contribution of signature to each sample, it can only be used for the result obtained by sig_extract() using NMF package.
n_cluster	only used when the method is 'k-means'.
match_consensus	only used when the method is 'consensus'. If TRUE, the result will match order as shown in consensus map.

Details

Users may find there are bigger differences between using method 'samples' and 'exposure' but they use a similar idear to find dominant signature, here goes the reason:

Method 'samples' using data directly from NMF decomposition, this means the two matrix W (basis matrix or signature matrix) and H (coefficient matrix or exposure matrix) are the results of NMF. For method 'exposure', it uses the signature exposure loading matrix. In this situation, each signture represents a number of mutations (alterations) about implementation please see source code of [sig_extract\(\)](#) function.

Value

a data.table object

See Also

[NMF::predict\(\)](#), [show_groups](#).

Examples

```
# Load copy number prepare object
load(system.file("extdata", "toy_copynumber_tally_W.RData",
  package = "sigminer", mustWork = TRUE
))
# Extract copy number signatures
library(NMF)
sig <- sig_extract(cn_tally_W$nmf_matrix, 2,
  nrun = 10,
  pConstant = 1e-13
)

# Methods 'consensus' and 'samples' are from NMF::predict()
get_groups(sig, method = "consensus", match_consensus = TRUE)
get_groups(sig, method = "samples")

# Use k-means clustering
get_groups(sig, method = "k-means")
```

get_group_comparison *Get Comparison Result between Signature Groups*

Description

Compare genotypes/phenotypes based on signature groups (samples are assigned to several groups). For categorical type, calculate fisher p value (using [stats::fisher.test](#)) and count table. In larger than 2 by 2 tables, compute p-values by Monte Carlo simulation. For continuous type, calculate anova p value (using [stats::aov](#)), summary table and Tukey Honest significant difference (using [stats::TukeyHSD](#)). The result of this function can be plotted by [show_group_comparison\(\)](#).

Usage

```
get_group_comparison(
  data,
  col_group,
  cols_to_compare,
  type = "ca",
  NAs = NA,
  verbose = FALSE
)
```

Arguments

data	a data.frame containing signature groups and genotypes/phenotypes (including categorical and continuous type data) want to analyze. User need to construct this data.frame by him/herself.
col_group	column name of signature groups.
cols_to_compare	column names of genotypes/phenotypes want to summarize based on groups.
type	a character vector with length same as cols_to_compare, 'ca' for categorical type and 'co' for continuous type.
NAs	default is NA, filter NAs for categorical columns. Otherwise a value (either length 1 or length same as cols_to_compare) fill NAs.
verbose	if TRUE, print extra information.

Value

a list contains data, summary, p value etc..

Author(s)

Shixiang Wang w_shixiang@163.com

Examples

```
load(system.file("extdata", "toy_copynumber_signature_by_M.RData",
  package = "sigminer", mustWork = TRUE
))

# Assign samples to clusters
groups <- get_groups(sig, method = "k-means")

set.seed(1234)

groups$prob <- rnorm(10)
groups$new_group <- sample(c("1", "2", "3", "4", NA), size = nrow(groups), replace = TRUE)

# Compare groups (filter NAs for categorical columns)
groups.cmp <- get_group_comparison(groups[, -1],
  col_group = "group",
  cols_to_compare = c("prob", "new_group"),
  type = c("co", "ca"), verbose = TRUE
)

# Compare groups (Set NAs of categorical columns to 'Rest')
groups.cmp2 <- get_group_comparison(groups[, -1],
  col_group = "group",
  cols_to_compare = c("prob", "new_group"),
  type = c("co", "ca"), NAs = "Rest", verbose = TRUE
)
```

`get_sig_cancer_type_index`*Obtain Signature Index for Cancer Types*

Description

Obtain Signature Index for Cancer Types

Usage

```
get_sig_cancer_type_index(  
  sig_type = c("legacy", "SBS", "DBS", "ID"),  
  seq_type = c("WGS", "WES"),  
  source = c("PCAWG", "TCGA", "nonPCAWG"),  
  keyword = NULL  
)
```

Arguments

<code>sig_type</code>	signature type.
<code>seq_type</code>	sequencing type.
<code>source</code>	data source.
<code>keyword</code>	keyword to search in the signature index database.

Value

a list.

Examples

```
l1 <- get_sig_cancer_type_index()  
l2 <- get_sig_cancer_type_index(sig_type = "SBS")  
l3 <- get_sig_cancer_type_index(sig_type = "DBS", source = "PCAWG", seq_type = "WGS")  
l4 <- get_sig_cancer_type_index(sig_type = "ID")  
l5 <- get_sig_cancer_type_index(keyword = "breast")  
l1  
l2  
l3  
l4  
l5
```

`get_sig_db`*Obtain Reference Signatures*

Description

The signatures and their aetiologies mainly obtained from COSMIC database (SigProfiler results) and cleaned before saving into **sigminer** package.

Usage

```
get_sig_db(sig_db = "legacy")
```

Arguments

`sig_db` default 'legacy', it can be 'legacy' (for **COSMIC v2 'SBS'**), 'SBS', 'DBS', 'ID' and 'TSB' (for **COSMIV v3.1 signatures**). For more specific details, it can also be 'SBS_hg19', 'SBS_hg38', 'SBS_mm9', 'SBS_mm10', 'DBS_hg19', 'DBS_hg38', 'DBS_mm9', 'DBS_mm10' to use COSMIC v3 reference signatures from Alexandrov, Ludmil B., et al. (2020) (reference #1). In addition, it can be one of "SBS_Nik_lab_Organ", "RS_Nik_lab_Organ", "SBS_Nik_lab", "RS_Nik_lab" to refer reference signatures from Degasper, Andrea, et al. (2020) (reference #2). **Note:** the signature profile for different genome builds are basically same. And specific database (e.g. 'SBS_mm10') contains less signatures than all COSMIC signatures (because some signatures are not detected from Alexandrov, Ludmil B., et al. (2020)).

Value

a list.

See Also

[get_sig_similarity](#), [sig_fit](#) and [show_cosmic_sig_profile](#).

Examples

```
s1 <- get_sig_db()
s2 <- get_sig_db("DBS")
s3 <- get_sig_db("DBS_mm10")
s4 <- get_sig_db("SBS_Nik_lab")
s5 <- get_sig_db("RS_Nik_lab")

get_sig_exposure *Get Signature Exposure from 'Signature' Object*

Description

The expected number of mutations (or copy number segment records) with each signature was determined after a scaling transformation $V \sim WH = W'H'$ where $W' = WU'$ and $H' = UH$. The scaling matrix U is a $K \times K$ diagonal matrix (K is signature number, U' is the inverse of U) with the element corresponding to the L1-norm of column vectors of W (ie. the sum of the elements of the vector). As a result, the k -th row vector of the final matrix H' represents the absolute exposure (activity) of the k -th process across samples (e.g., for SBS, the estimated (or expected) number of mutations generated by the k -th process). Of note, for copy number signatures, only components of feature CN was used for calculating H' .

Usage

```
get_sig_exposure(  
  Signature,  
  type = c("absolute", "relative"),  
  rel_threshold = 0.01  
)
```

Arguments

Signature	a Signature object obtained either from sig_extract or sig_auto_extract , or just a raw exposure matrix with column representing samples (patients) and row representing signatures.
type	'absolute' for signature exposure and 'relative' for signature relative exposure.
rel_threshold	only used when type is 'relative', relative exposure less than (\leq) this value will be set to 0 and thus all signature exposures may not sum to 1. This is similar to this argument in sig_fit .

Value

a `data.table`

Author(s)

Shixiang Wang w_shixiang@163.com

References

Kim, Jaegil, et al. "Somatic ERCC2 mutations are associated with a distinct genomic signature in urothelial tumors." *Nature genetics* 48.6 (2016): 600.

Examples

```
# Load mutational signature
load(system.file("extdata", "toy_mutational_signature.RData",
  package = "sigminer", mustWork = TRUE
))
# Get signature exposure
expo1 <- get_sig_exposure(sig2)
expo1
expo2 <- get_sig_exposure(sig2, type = "relative")
expo2
```

get_sig_feature_association

Calculate Association between Signature Exposures and Other Features

Description

Association of signature exposures with other features will be performed using one of two procedures: for a continuous association variable (including ordinal variable), correlation is performed; for a binary association variable, samples will be divided into two groups and Mann-Whitney U-test is performed to test for differences in signature exposure medians between the two groups. See [get_tidy_association](#) for cleaning association result.

Usage

```
get_sig_feature_association(
  data,
  cols_to_sigs,
  cols_to_features,
  type = "ca",
  method_co = c("spearman", "pearson", "kendall"),
  method_ca = stats::wilcox.test,
  min_n = 0.01,
  verbose = FALSE,
  ...
)
```

Arguments

data	a data.frame contains signature exposures and other features
cols_to_sigs	colnames for signature exposure
cols_to_features	colnames for other features
type	a character vector containing 'ca' for categorical variable and 'co' for continuous variable, it must have the same length as cols_to_features.

method_co	method for continuous variable, default is "spearman", could also be "pearson" and "kendall".
method_ca	method for categorical variable, default is "wilcox.test"
min_n	a minimal fraction (e.g. 0.01) or a integer number (e.g. 10) for filtering some variables with few positive events. Default is 0.01.
verbose	if TRUE, print extra message.
...	other arguments passing to test functions, like cor.test.

Value

a list. For 'co' features, 'measure' means correlation coefficient. For 'ca' features, 'measure' means difference in means of signature exposure.

[get_tidy_association](#)

get_sig_similarity	<i>Calculate Similarity between Identified Signatures and Reference Signatures</i>
--------------------	--

Description

The reference signatures can be either a Signature object specified by Ref argument or known COSMIC signatures specified by sig_db argument. Two COSMIC databases are used for comparisons - "legacy" which includes 30 signatures, and "SBS" - which includes updated/refined 65 signatures. This function is modified from compareSignatures() in **maftools** package. **NOTE:** all reference signatures are generated from gold standard tool: SigProfiler.

Usage

```
get_sig_similarity(
  Signature,
  Ref = NULL,
  sig_db = "legacy",
  db_type = c("", "human-exome", "human-genome"),
  method = "cosine",
  normalize = c("row", "feature"),
  feature_setting = sigminer::CN.features,
  set_order = TRUE,
  pattern_to_rm = NULL,
  verbose = TRUE
)
```

Arguments

Signature	a Signature object or a component-by-signature matrix/data.frame (sum of each column is 1) or a normalized component-by-sample matrix/data.frame (sum of each column is 1). More please see examples.
Ref	default is NULL, can be a same object as Signature.
sig_db	default 'legacy', it can be 'legacy' (for COSMIC v2 'SBS'), 'SBS', 'DBS', 'ID' and 'TSB' (for COSMIV v3.1 signatures). For more specific details, it can also be 'SBS_hg19', 'SBS_hg38', 'SBS_mm9', 'SBS_mm10', 'DBS_hg19', 'DBS_hg38', 'DBS_mm9', 'DBS_mm10' to use COSMIC v3 reference signatures from Alexandrov, Ludmil B., et al. (2020) (reference #1). In addition, it can be one of "SBS_Nik_lab_Organ", "RS_Nik_lab_Organ", "SBS_Nik_lab", "RS_Nik_lab" to refer reference signatures from Degasperi, Andrea, et al. (2020) (reference #2). Note: the signature profile for different genome builds are basically same. And specific database (e.g. 'SBS_mm10') contains less signatures than all COSMIC signatures (because some signatures are not detected from Alexandrov, Ludmil B., et al. (2020)).
db_type	only used when sig_db is enabled. "" for keeping default, "human-exome" for transforming to exome frequency of component, and "human-genome" for transforming to whole genome frequency of component. Currently only works for 'SBS'.
method	default is 'cosine' for cosine similarity.
normalize	one of "row" and "feature". "row" is typically used for common mutational signatures. "feature" is designed by me to use when input are copy number signatures.
feature_setting	a data.frame used for classification. Only used when method is "Wang" ("W") . Default is CN.features . Users can also set custom input with "feature", "min" and "max" columns available. Valid features can be printed by <code>unique(CN.features\$feature)</code> .
set_order	if TRUE, order the return similarity matrix.
pattern_to_rm	patterns for removing some features/components in similarity calculation. A vector of component name is also accepted. The remove operation will be done after normalization. Default is NULL.
verbose	if TRUE, print extra info.

Value

a list containing similarities, aetiologies if available, best match and RSS.

```

get_tidy_association *Get Tidy Signature Association Results*

Description

Get Tidy Signature Association Results

Usage

```
get_tidy_association(cor_res, p_adjust = FALSE, method = "fdr")
```

Arguments

cor_res	data returned by get_sig_feature_association()
p_adjust	logical, if TRUE, adjust p values by data type.
method	p value correction method, see stats::p.adjust for more detail.

Value

a `data.frame`

See Also

[get_sig_feature_association](#)

`get_tidy_parameter` *Get Tidy Parameter from Flexmix Model*

Description

When users derive copy number features, it is useful to know the parameters of the fit components, including mean, sd and coefficient of variation. This function is used by [sig_tally](#) function and exported to users for extra usage.

Usage

```
get_tidy_parameter(x)
```

Arguments

`x` a flexmix object or a list of flexmix objects.

Value

a tibble.

Examples

```
load(system.file("extdata", "toy_copynumber_tally_M.RData",
  package = "sigminer", mustWork = TRUE
))
# Get all parameters
d1 <- get_tidy_parameter(cn_tally_M$components)
d1
# Get parameters for segsize feature
d2 <- get_tidy_parameter(cn_tally_M$components$segsize)
d2
```

group_enrichment	<i>General Group Enrichment Analysis</i>
------------------	--

Description

This function takes a `data.frame` as input, compares proportion of positive cases or mean measure in one subgroup and the remaining samples.

Usage

```
group_enrichment(  
  df,  
  grp_vars = NULL,  
  enrich_vars = NULL,  
  cross = TRUE,  
  co_method = c("t.test", "wilcox.test")  
)
```

Arguments

<code>df</code>	a <code>data.frame</code> .
<code>grp_vars</code>	character vector specifying group variables to split samples into subgroups (at least 2 subgroups, otherwise this variable will be skipped).
<code>enrich_vars</code>	character vector specifying measure variables to be compared. If variable is not numeric, only binary cases are accepted in the form of TRUE/FALSE or P/N (P for positive cases and N for negative cases).
<code>cross</code>	logical, default is TRUE, combine all situations provided by <code>grp_vars</code> and <code>enrich_vars</code> . For examples, <code>c('A', 'B')</code> and <code>c('C', 'D')</code> will construct 4 combinations(i.e. "AC", "AD", "BC" and "BD"). A variable can not be in both <code>grp_vars</code> and <code>enrich_vars</code> , such cases will be automatically drop. If FALSE, use pairwise combinations, see section "examples" for use cases.
<code>co_method</code>	test method for continuous variable, default is 't.test'.

Value

a `data.table` with following columns:

- `grp_var`: group variable name.
- `enrich_var`: enrich variable (variable to be compared) name.
- `grp1`: the first group name, should be a member in `grp_var` column.
- `grp2`: the remaining samples, marked as 'Rest'.
- `grp1_size`: sample size for `grp1`.
- `grp1_pos_measure`: for binary variable, it stores the proportion of positive cases in `grp1`; for continuous variable, it stores mean value.

- `grp2_size`: sample size for `grp2`.
- `grp2_pos_measure`: same as `grp1_pos_measure` but for `grp2`.
- `measure_observed`: for binary variable, it stores odds ratio; for continuous variable, it stores scaled mean ratio.
- `measure_tested`: only for binary variable, it stores estimated odds ratio and its 95% CI from `fisher.test()`.
- `p_value`: for binary variable, it stores p value from `fisher.test()`; for continuous variable, it stores value from `wilcox.test()` or `t.test()`.
- `type`: one of "binary" and "continuous".
- `method`: one of "fish.test", "wilcox.test" and "t.test".

p3
```

handle_hyper_mutation *Handle Hypermutant Samples*

Description

This can be used for SNV/INDEL count matrix. For copy number analysis, please skip it.

Usage

```
handle_hyper_mutation(nmf_matrix)
```

Arguments

nmf_matrix a matrix used for NMF decomposition with rows indicate samples and columns indicate components.

Value

a matrix.

hello *Say Hello to Users*

Description

Say Hello to Users

Usage

```
hello()
```

Examples

```
hello()
```

MAF-class	<i>Class MAF</i>
-----------	------------------

Description

S4 class for storing summarized MAF. It is from `maftools` package.

Details

More about MAF object please see [maftools](#).

Slots

`data` `data.table` of MAF file containing all non-synonymous variants.
`variants.per.sample` table containing variants per sample
`variant.type.summary` table containing variant types per sample
`variant.classification.summary` table containing variant classification per sample
`gene.summary` table containing variant classification per gene
`summary` table with basic MAF summary stats
`maf.silent` subset of main MAF containing only silent variants
`clinical.data` clinical data associated with each sample/Tumor_Sample_Barcode in MAF.

output_bootstrap	<i>Output Signature Bootstrap Fitting Results</i>
------------------	---

Description

Output Signature Bootstrap Fitting Results

Usage

```
output_bootstrap(x, result_dir, mut_type = "SBS")
```

Arguments

<code>x</code>	result from sig_fit_bootstrap_batch .
<code>result_dir</code>	a result directory.
<code>mut_type</code>	one of 'SBS', 'DBS', 'ID' or 'CN'.

Value

Nothing.

output_fit	<i>Output Signature Fitting Results</i>
------------	---

Description

Output Signature Fitting Results

Usage

```
output_fit(x, result_dir, mut_type = "SBS")
```

Arguments

x	result from sig_fit .
result_dir	a result directory.
mut_type	one of 'SBS', 'DBS', 'ID' or 'CN'.

Value

Nothing.

output_sig	<i>Output Signature Results</i>
------------	---------------------------------

Description

Output Signature Results

Usage

```
output_sig(sig, result_dir, mut_type = "SBS")
```

Arguments

sig	a Signature object.
result_dir	a result directory.
mut_type	one of 'SBS', 'DBS', 'ID' or 'CN'.

Value

Nothing.

output_tally	<i>Output Tally Result in Barplots</i>
--------------	--

Description

Output Tally Result in Barplots

Usage

```
output_tally(x, result_dir, mut_type = "SBS")
```

Arguments

x	a matrix with row representing components (motifs) and column representing samples.
result_dir	a result directory.
mut_type	one of 'SBS', 'DBS', 'ID' or 'CN'.

Value

Nothing.

read_copynumber	<i>Read Absolute Copy Number Profile</i>
-----------------	--

Description

Read **absolute** copy number profile for preparing CNV signature analysis. See detail part of [sig_tally\(\)](#) to see how to handle sex to get correct summary.

Usage

```
read_copynumber(
  input,
  pattern = NULL,
  ignore_case = FALSE,
  seg_cols = c("Chromosome", "Start.bp", "End.bp", "modal_cn"),
  samp_col = "sample",
  add_loh = FALSE,
  loh_min_len = 10000,
  loh_min_frac = 0.05,
  join_adj_seg = TRUE,
  skip_annotation = FALSE,
  use_all = add_loh,
  min_segnum = 0L,
```

```

    max_copynumber = 20L,
    genome_build = c("hg19", "hg38", "mm10"),
    genome_measure = c("called", "wg"),
    complement = FALSE,
    ...
)

```

Arguments

input	a data.frame or a file or a directory contains copy number profile.
pattern	an optional regular expression used to select part of files if input is a directory, more detail please see list.files() function.
ignore_case	logical. Should pattern-matching be case-insensitive?
seg_cols	four strings used to specify chromosome, start position, end position and copy number value in input, respectively. Default use names from ABSOLUTE calling result.
samp_col	a character used to specify the sample column name. If input is a directory and cannot find samp_col, sample names will use file names (set this parameter to NULL is recommended in this case).
add_loh	if TRUE, add LOH labels to segments. NOTE a column 'minor_cn' must exist to indicate minor allele copy number value. Sex chromosome will not be labeled.
loh_min_len	The length cut-off for labeling a segment as 'LOH'. Default is 10Kb.
loh_min_frac	When join_adj_seg set to TRUE, only the length fraction of LOH region is larger than this value will be labeled as 'LOH'. Default is 30%.
join_adj_seg	if TRUE (default), join adjacent segments with same copy number value. This is helpful for precisely count the number of breakpoint. When set use_all=TRUE, the mean function will be applied to extra numeric columns and unique string columns will be pasted by comma for joined records.
skip_annotation	if TRUE, skip annotation step, it may affect some analysis and visualization functionality, but speed up reading data.
use_all	default is FALSE. If True, use all columns from raw input.
min_segnum	minimal number of copy number segments within a sample.
max_copynumber	bigger copy number within a sample will be reset to this value.
genome_build	genome build version, should be 'hg19', 'hg38' or 'mm10'.
genome_measure	default is 'called', can be 'wg' or 'called'. Set 'called' will use called segments size to compute total size for CNA burden calculation, this option is useful for WES and target sequencing. Set 'wg' will use autosome size from genome build, this option is useful for WGS, SNP etc..
complement	if TRUE, complement chromosome (except 'Y') does not show in input data with normal copy 2.
...	other parameters pass to data.table::fread()

Value

a [CopyNumber](#) object.

Author(s)

Shixiang Wang w_shixiang@163.com

See Also

[read_maf](#) for reading mutation data to [MAF](#) object.

Examples

```
# Load toy dataset of absolute copynumber profile
load(system.file("extdata", "toy_segTab.RData",
  package = "sigminer", mustWork = TRUE
))
cn <- read_copynumber(segTabs,
  seg_cols = c("chromosome", "start", "end", "segVal"),
  genome_build = "hg19", complement = FALSE
)
cn
cn_subset <- subset(cn, sample == "TCGA-DF-A2KN-01A-11D-A17U-01")

# Add LOH
set.seed(1234)
segTabs$minor_cn = sample(c(0, 1), size = nrow(segTabs), replace = TRUE)
cn <- read_copynumber(segTabs,
  seg_cols = c("chromosome", "start", "end", "segVal"),
  genome_measure = "wg", complement = TRUE, add_loh = TRUE
)

tab_file <- system.file("extdata", "metastatic_tumor.segtab.txt",
  package = "sigminer", mustWork = TRUE
)
cn2 <- read_copynumber(tab_file)
cn2
```

read_copynumber_seqz *Read Absolute Copy Number Profile from Sequenza Result Directory*

Description

Read Absolute Copy Number Profile from Sequenza Result Directory

Usage

```
read_copynumber_seqz(target_dir, return_df = FALSE, ...)
```

Arguments

target_dir a directory path.
 return_df if TRUE, return a `data.frame` directly, otherwise return a `CopyNumber` object.
 ... other parameters passing to `read_copynumber()`.

Value

a `data.frame` or a `CopyNumber` object.

read_maf	<i>Read MAF Files</i>
----------	-----------------------

Description

This function is a wrapper of `maftools::read.maf`. Useless options in `maftools::read.maf` are dropped here. You can also use `maftools::read.maf` to read the data. All reference alleles and mutation alleles should be recorded in positive strand format.

Usage

```
read_maf(maf, verbose = TRUE)
```

Arguments

maf tab delimited MAF file. File can also be gz compressed. Required. Alternatively, you can also provide already read MAF file as a dataframe.
 verbose TRUE logical. Default to be talkative and prints summary.

See Also

[read_copynumber](#) for reading copy number data to `CopyNumber` object.

Examples

```
laml.maf <- system.file("extdata", "tcga_laml.maf.gz", package = "maftools", mustWork = TRUE)
if (!require("R.utils")) {
  message("Please install 'R.utils' package firstly")
} else {
  laml <- read_maf(maf = laml.maf)
  laml
}
```

read_vcf	<i>Read VCF files as MAF object</i>
----------	-------------------------------------

Description

Read VCF files as MAF object

Usage

```
read_vcf(  
  vcfs,  
  samples = NULL,  
  genome_build = c("hg19", "hg38"),  
  keep_only_pass = TRUE,  
  verbose = TRUE  
)
```

Arguments

vcfs	VCF file paths.
samples	sample names for VCF files.
genome_build	genome build version like "hg19".
keep_only_pass	if TRUE, keep only 'PASS' mutation for analysis.
verbose	if TRUE, print extra info.

Value

a [MAF](#).

See Also

[read_maf](#), [read_copynumber](#)

Examples

```
vcfs <- list.files(system.file("extdata", package = "sigminer"), "*.vcf", full.names = TRUE)  
maf <- read_vcf(vcfs)  
maf <- read_vcf(vcfs, keep_only_pass = FALSE)
```

 report_bootstrap_p_value

Report P Values from bootstrap Results

Description

See examples in [sig_fit_bootstrap](#).

Usage

```
report_bootstrap_p_value(x, thresholds = c(0.01, 0.05, 0.1))
```

Arguments

x a (list of) result from [sig_fit_bootstrap](#).
 thresholds a vector of relative exposure threshold for calculating p values.

Value

a (list of) matrix

 same_size_clustering *Same Size Clustering*

Description

This is a wrapper for several implementation that classify samples into same size clusters, the details please see [this blog](#). The source code is modified based on code from the blog.

Usage

```
same_size_clustering(  
  mat,  
  diss = FALSE,  
  clsize = NULL,  
  algo = c("nnit", "hcbottom", "kmvar"),  
  method = c("maxd", "random", "mind", "elki", "ward.D", "average", "complete",  
             "single")  
)
```

Arguments

mat a data/distance matrix.
 diss if TRUE, treat mat as a distance matrix.
 clsize integer, number of sample within a cluster.
 algo algorithm.
 method method.

Value

a vector.

Examples

```
set.seed(1234L)
x <- rbind(matrix(rnorm(100, sd = 0.3), ncol = 2),
           matrix(rnorm(100, mean = 1, sd = 0.3), ncol = 2))
colnames(x) <- c("x", "y")

y1 <- same_size_clustering(x, clsize = 10)
y11 <- same_size_clustering(as.matrix(dist(x)), clsize = 10, diss = TRUE)

y2 <- same_size_clustering(x, clsize = 10, algo = "hcbottom", method = "ward.D")

y3 <- same_size_clustering(x, clsize = 10, algo = "kmvar")
y33 <- same_size_clustering(as.matrix(dist(x)), clsize = 10, algo = "kmvar", diss = TRUE)
```

scoring

Score Copy Number Profile

Description

Returns quantification of copy number profile and events including tandem duplication and Chromothripsis etc. Only copy number data from autosome is used here. **Some of the quantification methods are rough, you use at your risk.** You should do some extra work to check the result scores.

Usage

```
scoring(object, TD_size_cutoff = c(1000, 1e+05, 2e+06), TD_cn_cutoff = Inf)
```

Arguments

object	a object of CopyNumber .
TD_size_cutoff	a length-3 numeric vector used to specify the start, midpoint, end segment size for determining tandem duplication size range, midpoint is used to split TD into short TD and long TD. Default is 1Kb to 100Kb for short TD, 100Kb to 2Mb for long TD.
TD_cn_cutoff	a number defining the maximum copy number of TD, default is Inf, i.e. no cutoff.

Value

a data . table with following scores:

- cnaBurden: CNA burden representing the altered genomic fraction as previously reported.
- cnaLoad: CNA load representing the quantity of copy number alteration.
- MACN: mean altered copy number (MACN) reflecting the property of altered copy number segments, calculated as

$$MACN = \frac{\sum_i CN_i}{N_{cnv}}$$

where CN_i is the copy number of altered segment i , N_{cnv} is the number of CNV.

- weightedMACN: same as MACN but weighted with segment length.

$$MACN_{weighted} = \frac{\sum_i (CN_i \times L_i)}{\sum_i L_i}$$

where L_i is the length of altered copy number segment i .

- Ploidy: ploidy, the formula is same as weightedMACN but using all copy number segments instead of altered copy number segments.
- TDP_pnas: tandem duplication phenotype score from <https://www.pnas.org/content/113/17/E2373>, the threshold k in reference is omitted.

$$TDP = - \frac{\sum_{chr} |TD_{obs} - TD_{exp}|}{TD_{total}}$$

where TD_{total} is the number of TD, TD_{obs} and TD_{exp} are observed number of TD and expected number of TD for each chromosome.

- TDP: tandem duplication score used defined by our group work, TD represents segment with copy number greater than 2.

$$TD = \frac{TD_{total}}{\sum_{chr} |TD_{obs} - TD_{exp}| + 1}$$

- sTDP: TDP score for short TD.
- lTDP: TDP score for long TD.
- TDP_size : TDP region size (Mb).
- sTDP_size: sTDP region size (Mb).
- lTDP_size: lTDP region size(Mb).
- Chromoth_state: chromothripsis state score, according to reference <http://dx.doi.org/10.1016/j.cell.2013.02.023>, chromothripsis frequently leads to massive loss of segments on the affected chromosome with segmental losses being interspersed with regions displaying normal (disomic) copy-number (e.g., copy-number states oscillating between copy-number = 1 and copy-number = 2), form tens to hundreds of locally clustered DNA rearrangements. Most of methods use both SV and CNV to infer chromothripsis, here we roughly quantify it with

$$\sum_{chr} N_{OsCN}^2$$

where N_{OsCN} is the number of oscillating copy number pattern "2-1-2" for each chromosome.

Examples

```
# Load copy number object
load(system.file("extdata", "toy_copynumber.RData",
  package = "sigminer", mustWork = TRUE
))

d <- scoring(cn)
d

```

show_catalogue

Show Alteration Catalogue Profile

Description

Show Alteration Catalogue Profile

Usage

```
show_catalogue(
  catalogue,
  mode = c("SBS", "copynumber", "DBS", "ID", "RS"),
  method = "Wang",
  normalize = c("raw", "row", "feature"),
  style = c("default", "cosmic"),
  samples = NULL,
  samples_name = NULL,
  x_lab = "Components",
  y_lab = "Counts",
  ...
)
```

Arguments

catalogue	result from sig_tally or a matrix with row representing components (motifs) and column representing samples
mode	signature type for plotting, now supports 'copynumber', 'SBS', 'DBS', 'ID' and 'RS' (genome rearrangement signature).
method	method for copy number feature classification in sig_tally , can be one of "Macintyre" ("M"), "Wang" ("W").
normalize	normalize method.
style	plot style, one of 'default' and 'cosmic'.
samples	default is NULL, show sum of all samples in one row. If not NULL, show specified samples.

samples_name	set the sample names shown in plot.
x_lab	x axis lab.
y_lab	y axis lab.
...	other arguments passing to show_sig_profile .

Value

a ggplot object

Examples

```
load(system.file("extdata", "toy_copynumber_tally_M.RData",
  package = "sigminer", mustWork = TRUE
))
p <- show_catalogue(cn_tally_M,
  mode = "copynumber", method = "M",
  style = "cosmic", paint_axis_text = FALSE
)
p
```

show_cn_circos	<i>Show Copy Number Profile in Circos</i>
----------------	---

Description

Another visualization method for copy number profile like [show_cn_profile](#).

Usage

```
show_cn_circos(
  data,
  samples = NULL,
  show_title = TRUE,
  chrs = paste0("chr", 1:22),
  genome_build = c("hg19", "hg38", "mm10"),
  col = NULL,
  side = "inside",
  ...
)
```

Arguments

data	a CopyNumber object or a data.frame containing at least 'chromosome', 'start', 'end', 'segVal' these columns.
samples	default is NULL, can be a character vector representing multiple samples or number of samples to show. If data argument is a data.frame, a column called sample must exist.

show_title if TRUE (default), show title with sample ID.

chrs chromosomes start with 'chr'.

genome_build genome build version, used when data is a data.frame, should be 'hg19' or 'hg38'.

col colors for the heatmaps. If it is NULL, set to `circlize::colorRamp2(c(1,2,4),c("blue","black","red"))`.

side side of the heatmaps.

... other parameters passing to `circlize::circos.genomicHeatmap`.

Value

a circos plot

Examples

```
load(system.file("extdata", "toy_copynumber.RData",
  package = "sigminer", mustWork = TRUE
))

show_cn_circos(cn, samples = 1)
show_cn_circos(cn, samples = "TCGA-99-7458-01A-11D-2035-01")

## Remove title
show_cn_circos(cn, samples = 1, show_title = FALSE)

## Subset chromosomes
show_cn_circos(cn, samples = 1, chrs = c("chr1", "chr2", "chr3"))

## Arrange plots
layout(matrix(1:4, 2, 2))
show_cn_circos(cn, samples = 4)

layout(1) # reset layout
```

show_cn_components *Show Copy Number Components*

Description

Show mixture fit model components ("Macintyre" ("M") method) or standard classified components ("Wang" ("W") method) for copy number data.

Usage

```

show_cn_components(
  parameters,
  method = "Macintyre",
  show_weights = TRUE,
  log_segsizes = TRUE,
  log_y = FALSE,
  auto_transform = TRUE,
  return_plotlist = FALSE,
  base_size = 12,
  nrow = 2,
  align = "hv",
  ...
)

```

Arguments

parameters	a data.frame contain parameter components, obtain this from sig_tally function.
method	method for feature classification, can be one of "Macintyre" ("M"), "Wang" ("W").
show_weights	default is TRUE, show weights for each component. Only used when method is "Macintyre".
log_segsizes	default is TRUE, show log ₁₀ based segsize, only works for input from "Macintyre" ("M") method.
log_y	logical, if TRUE, show log ₁₀ based y axis, only works for input from "Wang" ("W") method.
auto_transform	default is TRUE, it will auto increase the SD for components for showing them better in the plot. Only used when method is "Macintyre".
return_plotlist	if TRUE, return a list of ggplot objects but a combined plot.
base_size	overall font size.
nrow	(optional) Number of rows in the plot grid.
align	(optional) Specifies whether graphs in the grid should be horizontally ("h") or vertically ("v") aligned. Options are "none" (default), "hv" (align in both directions), "h", and "v".
...	other options pass to plot_grid function of cowplot package.

Value

a ggplot object

Author(s)

Shixiang Wang w_shixiang@163.com

Examples

```

load(system.file("extdata", "toy_copynumber_tally_M.RData",
  package = "sigminer", mustWork = TRUE
))
p1 <- show_cn_components(cn_tally_M$parameters)
p1
p2 <- show_cn_components(cn_tally_M$parameters, show_weights = FALSE)
p2

load(system.file("extdata", "toy_copynumber_tally_W.RData",
  package = "sigminer", mustWork = TRUE
))
p3 <- show_cn_components(cn_tally_W$parameters, method = "W")
p3

```

show_cn_distribution *Show Copy Number Distribution either by Length or Chromosome*

Description

Visually summarize copy number distribution either by copy number segment length or chromosome. Input is a [CopyNumber](#) object, genome_build option will read from genome_build slot of object.

Usage

```

show_cn_distribution(
  data,
  rm_normal = TRUE,
  mode = c("ld", "cd"),
  fill = FALSE,
  scale_chr = TRUE,
  base_size = 14
)

```

Arguments

data	a CopyNumber object.
rm_normal	logical. Whether remove normal copy (i.e. "segVal" equals 2), default is TRUE.
mode	either "ld" for distribution by CN length or "cd" for distribution by chromosome.
fill	when mode is "cd" and fill is TRUE, plot percentage instead of count.
scale_chr	logical. If TRUE, normalize count to per Megabase unit.
base_size	overall font size.

Value

a ggplot object

Author(s)

Shixiang Wang w_shixiang@163.com

Examples

```
# Load copy number object
load(system.file("extdata", "toy_copynumber.RData",
  package = "sigminer", mustWork = TRUE
))
# Plot distribution
p1 <- show_cn_distribution(cn)
p1
p2 <- show_cn_distribution(cn, mode = "cd")
p2
p3 <- show_cn_distribution(cn, mode = "cd", fill = TRUE)
p3
```

show_cn_features

Show Copy Number Feature Distributions

Description

Show Copy Number Feature Distributions

Usage

```
show_cn_features(
  features,
  method = "Macintyre",
  rm_outlier = FALSE,
  ylab = NULL,
  log_segsize = TRUE,
  log_y = FALSE,
  return_plotlist = FALSE,
  base_size = 12,
  nrow = 2,
  align = "hv",
  ...
)
```

Arguments

features	a feature list generate from sig_tally function.
method	method for feature classification, can be one of "Macintyre" ("M"), "Wang" ("W").
rm_outlier	default is FALSE, if TRUE, remove outliers. Only works when method is "Wang" ("W").

ylab	lab of y axis.
log_segsizes	default is TRUE, show log10 based segsizes, only works for input from "Macintyre" ("M") method.
log_y	logical, if TRUE, show log10 based y axis, only works for input from "Wang" ("W") method.
return_plotlist	if TRUE, return a list of ggplot objects but a combined plot.
base_size	overall font size.
nrow	(optional) Number of rows in the plot grid.
align	(optional) Specifies whether graphs in the grid should be horizontally ("h") or vertically ("v") aligned. Options are "none" (default), "hv" (align in both directions), "h", and "v".
...	other options pass to plot_grid function of cowplot package.

Value

a ggplot object

Examples

```
# Load copy number prepare object
load(system.file("extdata", "toy_copynumber_tally_M.RData",
  package = "sigminer", mustWork = TRUE
))
p <- show_cn_features(cn_tally_M$features)
p
```

show_cn_freq_circos *Show Copy Number Variation Frequency Profile with Circos*

Description

Show Copy Number Variation Frequency Profile with Circos

Usage

```
show_cn_freq_circos(
  data,
  groups = NULL,
  cutoff = 2L,
  resolution_factor = 1L,
  title = c("AMP", "DEL"),
  chrs = paste0("chr", 1:22),
  genome_build = c("hg19", "hg38", "mm10"),
  cols = NULL,
  plot_ideogram = TRUE,
```

```

    track_height = 0.5,
    ideogram_height = 1,
    ...
)

```

Arguments

data	a CopyNumber object or a data.frame containing at least 'chromosome', 'start', 'end', 'segVal', 'sample' these columns.
groups	a named list or a column name for specifying groups.
cutoff	copy number value cutoff for splitting data into AMP and DEL. The values equal to cutoff are discarded. Default is 2, you can also set a length-2 vector, e.g. c(2,2).
resolution_factor	an integer to control the resolution. When it is 1 (default), compute frequency in each cytoband. When it is 2, use compute frequency in each half cytoband.
title	length-2 titles for AMP and DEL.
chrs	chromosomes start with 'chr'.
genome_build	genome build version, used when data is a data.frame, should be 'hg19' or 'hg38'.
cols	length-2 colors for AMP and DEL.
plot_ideogram	default is TRUE, show ideogram.
track_height	track height in mm unit.
ideogram_height	ideogram height in mm unit.
...	other parameters passing to circlize::circos.genomicLines .

Value

Nothing.

Examples

```

load(system.file("extdata", "toy_copynumber.RData",
  package = "sigminer", mustWork = TRUE
))

show_cn_freq_circos(cn)
ss <- unique(cn@data$sample)
show_cn_freq_circos(cn, groups = list(a = ss[1:5], b = ss[6:10]), cols = c("red", "green"))

```

show_cn_group_profile *Show Summary Copy Number Profile for Sample Groups*

Description

Show Summary Copy Number Profile for Sample Groups

Usage

```
show_cn_group_profile(
  data,
  groups = NULL,
  fill_area = TRUE,
  cols = NULL,
  chrs = paste0("chr", c(1:22, "X")),
  genome_build = c("hg19", "hg38", "mm10"),
  cutoff = 2L,
  resolution_factor = 1L,
  force_y_limit = TRUE,
  highlight_genes = NULL,
  nrow = NULL,
  ncol = NULL,
  return_plotlist = FALSE
)
```

Arguments

data	a CopyNumber object or a data.frame containing at least 'chromosome', 'start', 'end', 'segVal', 'sample' these columns.
groups	a named list or a column name for specifying groups.
fill_area	default is TRUE, fill area with colors.
cols	length-2 colors for AMP and DEL.
chrs	chromosomes start with 'chr'.
genome_build	genome build version, used when data is a data.frame, should be 'hg19' or 'hg38'.
cutoff	copy number value cutoff for splitting data into AMP and DEL. The values equal to cutoff are discarded. Default is 2, you can also set a length-2 vector, e.g. c(2, 2).
resolution_factor	an integer to control the resolution. When it is 1 (default), compute frequency in each cytoband. When it is 2, use compute frequency in each half cytoband.
force_y_limit	default is TRUE, force multiple plots
highlight_genes	gene list to highlight. have same y ranges. You can also set a length-2 numeric value.

nrow number of rows in the plot grid when multiple samples are selected.
 ncol number of columns in the plot grid when multiple samples are selected.
 return_plotlist default is FALSE, if TRUE, return a plot list instead of a combined plot.

Value

a (list of) ggplot object.

Examples

```
load(system.file("extdata", "toy_copynumber.RData",
  package = "sigminer", mustWork = TRUE
))

p1 <- show_cn_group_profile(cn)
p1

ss <- unique(cn@data$sample)
p2 <- show_cn_group_profile(cn, groups = list(a = ss[1:5], b = ss[6:10]))
p2
p3 <- show_cn_group_profile(cn,
  groups = list(g1 = ss[1:5], g2 = ss[6:10]),
  force_y_limit = c(-1, 1), nrow = 2
)
p3

## Set custom cutoff for custom data
data <- cn@data
data$segVal <- data$segVal - 2L
p4 <- show_cn_group_profile(data,
  groups = list(g1 = ss[1:5], g2 = ss[6:10]),
  force_y_limit = c(-1, 1), nrow = 2,
  cutoff = c(0, 0)
)
p4

## Add highlight gene
p5 <- show_cn_group_profile(cn, highlight_genes = c("TP53", "EGFR"))
p5
```

show_cn_profile

Show Sample Copy Number Profile

Description

Sometimes it is very useful to check details about copy number profile for one or multiple samples. This function is designed to do this job and can be further modified by **ggplot2** related packages.

Usage

```
show_cn_profile(
  data,
  samples = NULL,
  show_n = NULL,
  show_title = FALSE,
  show_labels = NULL,
  chrs = paste0("chr", 1:22),
  position = NULL,
  genome_build = c("hg19", "hg38", "mm10"),
  ylim = NULL,
  nrow = NULL,
  ncol = NULL,
  return_plotlist = FALSE
)
```

Arguments

data	a CopyNumber object or a data.frame containing at least 'chromosome', 'start', 'end', 'segVal' these columns.
samples	default is NULL, can be a character vector representing multiple samples. If data argument is a data.frame, a column called sample must exist.
show_n	number of samples to show, this is used for checking.
show_title	if TRUE, show title for multiple samples.
show_labels	one of NULL, "s" (for labelling short segments < 1e7) or "a" (all segments).
chrs	chromosomes start with 'chr'.
position	a position range, e.g. "chr1:3218923-116319008". Only data overlaps with this range will be shown.
genome_build	genome build version, used when data is a data.frame, should be 'hg19' or 'hg38'.
ylim	limites for y axis.
nrow	number of rows in the plot grid when multiple samples are selected.
ncol	number of columns in the plot grid when multiple samples are selected.
return_plotlist	default is FALSE, if TRUE, return a plot list instead of a combined plot.

Value

a ggplot object or a list

Examples

```
# Load copy number object
load(system.file("extdata", "toy_copynumber.RData",
  package = "sigminer", mustWork = TRUE
))
```

```

p <- show_cn_profile(cn, nrow = 2, ncol = 1)
p

p2 <- show_cn_profile(cn,
  nrow = 2, ncol = 1,
  position = "chr1:3218923-116319008"
)
p2

```

show_cor

A Simple and General Way for Association Analysis

Description

All variables must be continuous. The matrix will be returned as an element of ggplot object. This is basically a wrapper of R package [ggcorrplot](#).

Usage

```

show_cor(
  data,
  x_vars = colnames(data),
  y_vars = x_vars,
  cor_method = "spearman",
  vis_method = "square",
  lab = TRUE,
  test = TRUE,
  hc_order = FALSE,
  p_adj = NULL,
  ...
)

```

Arguments

data	a data.frame.
x_vars	variables/column names shown in x axis.
y_vars	variables/column names shown in y axis.
cor_method	method for correlation, default is 'spearman'.
vis_method	visualization method, default is 'square', can also be 'circle'.
lab	logical value. If TRUE, add correlation coefficient on the plot.
test	if TRUE, run test for correlation and mark significance.
hc_order	logical value. If TRUE, correlation matrix will be hc.ordered using hclust function.
p_adj	p adjust method, see stats::p.adjust for details.
...	other parameters passing to <code>ggcorrplot::ggcorrplot()</code> .

Value

a ggplot object

See Also

[show_sig_feature_corrplot](#) for specific and more powerful association analysis and visualization.

Examples

```
data("mtcars")
p1 <- show_cor(mtcars)
p2 <- show_cor(mtcars,
               x_vars = colnames(mtcars)[1:4],
               y_vars = colnames(mtcars)[5:8])
p3 <- show_cor(mtcars, vis_method = "circle", p_adj = "fdr")
p1
p1$cor
p2
p3

## Auto detect problem variables
mtcars$xx <- 0L
p4 <- show_cor(mtcars)
p4
```

show_cosmic

Show Signature Information in Web Browser

Description

Show Signature Information in Web Browser

Usage

```
show_cosmic(x = "home")
```

Arguments

x a string indicating location ("home" for COSMIC signature home, "legacy" for COSMIC v2 signatures, "SBS" for COSMIC v3 SBS signatures, "DBS" for COSMIC v3 DBS signatures, "ID" for COSMIC v3 INDEL signatures) or signature index (e.g. "SBS1", "DBS2", "ID3").

Value

Nothing.

Examples

```
## Not run:
show_cosmic()
show_cosmic("legacy")
show_cosmic("SBS")
show_cosmic("DBS")
show_cosmic("ID")
show_cosmic("SBS1")
show_cosmic("DBS2")
show_cosmic("ID3")

## End(Not run)
```

```
show_cosmic_sig_profile
```

Plot Reference (Mainly COSMIC) Signature Profile

Description

Plot Reference (Mainly COSMIC) Signature Profile

Usage

```
show_cosmic_sig_profile(
  sig_index = NULL,
  show_index = TRUE,
  sig_db = "legacy",
  ...
)
```

Arguments

sig_index	a vector for signature index. "ALL" for all signatures.
show_index	if TRUE, show valid indices.
sig_db	default 'legacy', it can be 'legacy' (for COSMIC v2 'SBS'), 'SBS', 'DBS', 'ID' and 'TSB' (for COSMIV v3.1 signatures). For more specific details, it can also be 'SBS_hg19', 'SBS_hg38', 'SBS_mm9', 'SBS_mm10', 'DBS_hg19', 'DBS_hg38', 'DBS_mm9', 'DBS_mm10' to use COSMIC v3 reference signatures from Alexandrov, Ludmil B., et al. (2020) (reference #1). In addition, it can be one of "SBS_Nik_lab_Organ", "RS_Nik_lab_Organ", "SBS_Nik_lab", "RS_Nik_lab" to refer reference signatures from Degasper, Andrea, et al. (2020) (reference #2). Note: the signature profile for different genome builds are basically same. And specific database (e.g. 'SBS_mm10') contains less signatures than all COSMIC signatures (because some signatures are not detected from Alexandrov, Ludmil B., et al. (2020)).
...	other arguments passing to show_sig_profile .

Value

a ggplot object

Author(s)

Shixiang Wang w_shixiang@163.com

Examples

```
show_cosmic_sig_profile()
show_cosmic_sig_profile(sig_db = "SBS")
show_cosmic_sig_profile(sig_index = 1:5)
show_cosmic_sig_profile(sig_db = "SBS", sig_index = c("10a", "17a"))

gg <- show_cosmic_sig_profile(sig_index = 1:5)
gg$aetiology
```

show_groups

Show Signature Contribution in Clusters

Description

See example section in [sig_fit\(\)](#) for an examples.

Usage

```
show_groups(grp_dt, ...)
```

Arguments

grp_dt a result data.table from [get_groups](#).
... parameters passing to [legend\(\)](#), e.g. x = "topleft".

Value

nothing.

See Also

[get_groups](#), [sig_fit](#).

`show_group_comparison` *Plot Group Comparison Result*

Description

Using result data from `get_group_comparison`, this function plots genotypes/phenotypes comparison between signature groups using `ggplot2` package and return a list of `ggplot` object contains individual and combined plots. The combined plot is easily saved to local using `cowplot::save_plot()`. Of note, default fisher test p values are shown for categorical data and fdr values are shown for continuous data.

Usage

```
show_group_comparison(  
  group_comparison,  
  xlab = "group",  
  ylab_co = NA,  
  legend_title_ca = NA,  
  legend_position_ca = "bottom",  
  set_ca_sig_yaxis = FALSE,  
  set_ca_custom_xlab = FALSE,  
  show_pvalue = TRUE,  
  ca_p_threshold = 0.01,  
  method = "wilcox.test",  
  p.adjust.method = "fdr",  
  base_size = 12,  
  font_size_x = 12,  
  text_angle_x = 30,  
  text_hjust_x = 0.2,  
  ...  
)
```

Arguments

<code>group_comparison</code>	a list from result of <code>get_group_comparison</code> function.
<code>xlab</code>	lab name of x axis for all plots. if it is NA, remove title for x axis.
<code>ylab_co</code>	lab name of y axis for plots of continuous type data. Of note, this argument should be a character vector has same length as <code>group_comparison</code> , the location for categorical type data should mark with NA.
<code>legend_title_ca</code>	legend title for plots of categorical type data.
<code>legend_position_ca</code>	legend position for plots of categorical type data. Of note, this argument should be a character vector has same length as <code>group_comparison</code> , the location for continuous type data should mark with NA.

`set_ca_sig_yaxis` if TRUE, use y axis to show signature proportion instead of variable proportion.

`set_ca_custom_xlab` only works when `set_ca_sig_yaxis` is TRUE. If TRUE, set x labels using input `xlab`, otherwise variable names will be used.

`show_pvalue` if TRUE, show p values.

`ca_p_threshold` a p threshold for categorical variables, default is 0.01. A p value less than 0.01 will be shown as $P < 0.01$.

`method` a character string indicating which method to be used for comparing means. It can be 't.test', 'wilcox.test' etc..

`p.adjust.method` correction method, default is 'fdr'. Run `p.adjust.methods` to see all available options.

`base_size` overall font size.

`font_size_x` font size for x.

`text_angle_x` text angle for x.

`text_hjust_x` adjust x axis text

... other paramters pass to `ggpubr::compare_means()` or `ggpubr::stat_compare_means()` according to the specified method.

Value

a list of ggplot objects.

Author(s)

Shixiang Wang w_shixiang@163.com

Examples

```
load(system.file("extdata", "toy_copynumber_signature_by_M.RData",
  package = "sigminer", mustWork = TRUE
))

# Assign samples to clusters
groups <- get_groups(sig, method = "k-means")

set.seed(1234)

groups$prob <- rnorm(10)
groups$new_group <- sample(c("1", "2", "3", "4", NA), size = nrow(groups), replace = TRUE)

# Compare groups (filter NAs for categorical columns)
groups.cmp <- get_group_comparison(groups[, -1],
  col_group = "group",
  cols_to_compare = c("prob", "new_group"),
  type = c("co", "ca"), verbose = TRUE
)
```

```
# Compare groups (Set NAs of categorical columns to 'Rest')
groups.cmp2 <- get_group_comparison(groups[, -1],
  col_group = "group",
  cols_to_compare = c("prob", "new_group"),
  type = c("co", "ca"), NAs = "Rest", verbose = TRUE
)

show_group_comparison(groups.cmp)

ggcomp <- show_group_comparison(groups.cmp2)
ggcomp$co_comb
ggcomp$ca_comb
```

show_group_distribution

Show Grouped Variable Distribution

Description

This is a general function, it can be used in any proper analysis.

Usage

```
show_group_distribution(
  data,
  gvar,
  dvar,
  fun = stats::median,
  order_by_fun = FALSE,
  alpha = 0.8,
  g_label = "label",
  g_angle = 0,
  g_position = "top",
  point_size = 1L,
  segment_size = 1L,
  segment_color = "red",
  xlab = NULL,
  ylab = NULL,
  nrow = 1L,
  background_color = c("#DCDCDC", "#F5F5F5")
)
```

Arguments

data	a data.frame.
gvar	a group variable name/index.
dvar	a distribution variable name/index.

fun	a function to summarize, default is <code>stats::median</code> , can also be <code>mean</code> .
order_by_fun	if TRUE, reorder the groups by summary measure computed by argument fun.
alpha	alpha for points, range from 0 to 1.
g_label	a string 'label' (default) for labeling with sample size, or 'norm' to show just group name, or a named vector to set facet labels.
g_angle	angle for facet labels, default is 0.
g_position	position for facet labels, default is 'top', can also be 'bottom'.
point_size	size of point.
segment_size	size of segment.
segment_color	color of segment.
xlab	title for x axis.
ylab	title for y axis.
nrow	number of row.
background_color	background color for plot panel.

Value

a ggplot object.

Author(s)

Shixiang Wang w_shixiang@163.com

Examples

```
set.seed(1234)
data <- data.frame(
  yval = rnorm(120),
  gr = c(rep("A", 50), rep("B", 40), rep("C", 30))
)
p <- show_group_distribution(data,
  gvar = 2, dvar = 1,
  g_label = "norm",
  background_color = "grey"
)
p
p2 <- show_group_distribution(data,
  gvar = "gr", dvar = "yval",
  g_position = "bottom",
  order_by_fun = TRUE,
  alpha = 0.3
)
p2

# Set custom group names
p3 <- show_group_distribution(data,
```

```

    gvar = 2, dvar = 1,
    g_label = c("A"="X", "B"="Y", "C"="Z")
  )
p3

```

show_group_enrichment *Show Group Enrichment Result*

Description

See [group_enrichment](#) for examples.

Usage

```

show_group_enrichment(
  df_enrich,
  return_list = FALSE,
  scales = "free",
  add_text_annotation = TRUE,
  fill_by_p_value = TRUE,
  fill_scale = scale_fill_gradient2(low = "blue", mid = "white", high = "red", midpoint
    = ifelse(fill_by_p_value, 0, 1)),
  ...
)

```

Arguments

<code>df_enrich</code>	result data.frame from group_enrichment .
<code>return_list</code>	if TRUE, return a list of ggplot object so user can combine multiple plots by other R packages like patchwork.
<code>scales</code>	Should scales be fixed ("fixed", the default), free ("free"), or free in one dimension ("free_x", "free_y")?
<code>add_text_annotation</code>	if TRUE, add text annotation in box. When show p value with filled color, the text indicates relative change; when show relative change with filled color, the text indicates p value.
<code>fill_by_p_value</code>	if TRUE, show log10 based p values with filled color. The +/- of p values indicates change direction.
<code>fill_scale</code>	a Scale object generated by ggplot2 package to set color for continuous values.
<code>...</code>	other parameters passing to ggplot2::facet_wrap , only used when <code>return_list</code> is FALSE.

Value

a (list of) ggplot object.

show_group_mapping *Map Groups using Sankey*

Description

This feature is designed for signature analysis. However, users can also use it in other similar situations.

Usage

```
show_group_mapping(  
  data,  
  col_to_flow,  
  cols_to_map,  
  include_sig = FALSE,  
  fill_na = FALSE,  
  title = NULL,  
  xlab = NULL,  
  ylab = NULL,  
  custom_theme = cowplot::theme_minimal_hgrid()  
)
```

Arguments

data	a data.frame containing signature group and other categorical groups.
col_to_flow	length-1 character showing the column to flow, typically a signature group.
cols_to_map	character vector showing colnames of other groups.
include_sig	default if FALSE, if TRUE, showing signature group.
fill_na	length-1 string to fill NA, default is FALSE.
title	the title.
xlab	label for x axis.
ylab	label for y axis.
custom_theme	theme for plotting, default is cowplot::theme_minimal_hgrid().

Value

a ggplot object

Examples

```
data <- dplyr::tibble(  
  Group1 = rep(LETTERS[1:5], each = 10),  
  Group2 = rep(LETTERS[6:15], each = 5),  
  zzzz = c(rep("xx", 20), rep("yy", 20), rep(NA, 10))  
)
```

```
p1 <- show_group_mapping(data, col_to_flow = "Group1", cols_to_map = colnames(data)[-1])
p1

p2 <- show_group_mapping(data,
  col_to_flow = "Group1", cols_to_map = colnames(data)[-1],
  include_sig = TRUE
)
p2
```

show_sig_bootstrap *Show Signature Bootstrap Analysis Results*

Description

See details for description.

Usage

```
show_sig_bootstrap_exposure(
  bt_result,
  sample = NULL,
  signatures = NULL,
  methods = "QP",
  plot_fun = c("boxplot", "violin"),
  agg_fun = c("mean", "median", "min", "max"),
  highlight = "auto",
  highlight_size = 4,
  palette = "aaas",
  title = NULL,
  xlab = FALSE,
  ylab = "Signature exposure",
  width = 0.3,
  dodge_width = 0.8,
  outlier.shape = NA,
  add = "jitter",
  add.params = list(alpha = 0.3),
  ...
)

show_sig_bootstrap_error(
  bt_result,
  sample = NULL,
  methods = "QP",
  plot_fun = c("boxplot", "violin"),
  agg_fun = c("mean", "median"),
  highlight = "auto",
  highlight_size = 4,
  palette = "aaas",
```

```

    title = NULL,
    xlab = FALSE,
    ylab = "Reconstruction error (L2 norm)",
    width = 0.3,
    dodge_width = 0.8,
    outlier.shape = NA,
    add = "jitter",
    add.params = list(alpha = 0.3),
    legend = "none",
    ...
)

show_sig_bootstrap_stability(
  bt_result,
  signatures = NULL,
  measure = c("RMSE", "CV", "MAE", "AbsDiff"),
  methods = "QP",
  plot_fun = c("boxplot", "violin"),
  palette = "aaas",
  title = NULL,
  xlab = FALSE,
  ylab = "Signature instability",
  width = 0.3,
  outlier.shape = NA,
  add = "jitter",
  add.params = list(alpha = 0.3),
  ...
)

```

Arguments

<code>bt_result</code>	result object from sig_fit_bootstrap_batch .
<code>sample</code>	a sample id.
<code>signatures</code>	signatures to show.
<code>methods</code>	a subset of <code>c("NNLS", "QP", "SA")</code> .
<code>plot_fun</code>	set the plot function.
<code>agg_fun</code>	set the aggregation function when <code>sample</code> is <code>NULL</code> .
<code>highlight</code>	set the color for optimal solution. Default is "auto", which use the same color as bootstrap results, you can set it to color like "red", "gold", etc.
<code>highlight_size</code>	size for highlighting triangle, default is 4.
<code>palette</code>	the color palette to be used for coloring or filling by groups. Allowed values include "grey" for grey color palettes; brewer palettes e.g. "RdBu", "Blues", ...; or custom color palette e.g. <code>c("blue", "red")</code> ; and scientific journal palettes from ggsci R package, e.g.: "npg", "aaas", "lancet", "jco", "ucscgb", "uchicago", "simpsons" and "rickandmorty".
<code>title</code>	plot main title.

xlab	character vector specifying x axis labels. Use xlab = FALSE to hide xlab.
ylab	character vector specifying y axis labels. Use ylab = FALSE to hide ylab.
width	numeric value between 0 and 1 specifying box width.
dodge_width	dodge width.
outlier.shape	point shape of outlier. Default is 19. To hide outlier, specify outlier.shape = NA. When jitter is added, then outliers will be automatically hidden.
add	character vector for adding another plot element (e.g.: dot plot or error bars). Allowed values are one or the combination of: "none", "dotplot", "jitter", "boxplot", "point", "mean", "mean_se", "mean_sd", "mean_ci", "mean_range", "median", "median_iqr", "median_hilow", "median_q1q3", "median_mad", "median_range"; see ?desc_statby for more details.
add.params	parameters (color, shape, size, fill, linetype) for the argument 'add'; e.g.: add.params = list(color = "red").
...	other parameters passing to ggpubr::ggboxplot or ggpubr::ggviolin .
legend	character specifying legend position. Allowed values are one of c("top", "bottom", "left", "right", "none"). To remove the legend use legend = "none". Legend position can be also specified using a numeric vector c(x, y); see details section.
measure	measure to estimate the exposure instability, can be one of 'RMSE', 'CV', 'MAE' and 'AbsDiff'.

Details

Functions:

- [show_sig_bootstrap_exposure](#) - this function plots exposures from bootstrap samples with both dotted boxplot. The optimal exposure (the exposure from original input) is shown as triangle point. **Only one sample can be plotted.**
- [show_sig_bootstrap_error](#) - this function plots decomposition errors from bootstrap samples with both dotted boxplot. The error from optimal solution (the decomposition error from original input) is shown as triangle point. **Only one sample can be plotted.**
- [show_sig_bootstrap_stability](#) - this function plots the signature exposure instability for specified signatures. Currently, the instability measure supports 3 types:
 - 'RMSE' for Mean Root Squared Error (default) of bootstrap exposures and original exposures for each sample.
 - 'CV' for Coefficient of Variation (CV) based on RMSE (i.e. $RMSE / btExposure_mean$).
 - 'MAE' for Mean Absolute Error of bootstrap exposures and original exposures for each sample.
 - 'AbsDiff' for Absolute Difference between mean bootstram exposure and original exposure.

Value

a ggplot object

show_sig_consensusmap *Show Signature Consensus Map*

Description

This function is a wrapper of `NMF::consensusmap()`.

Usage

```

show_sig_consensusmap(
  sig,
  main = "Consensus matrix",
  tracks = c("consensus:", "silhouette:"),
  lab_row = NA,
  lab_col = NA,
  ...
)

```

Arguments

<code>sig</code>	a Signature object obtained from sig_extract .
<code>main</code>	Main title as a character string or a grob.
<code>tracks</code>	Special additional annotation tracks to highlight associations between basis components and sample clusters: basis matches each row (resp. column) to the most contributing basis component in <code>basismap</code> (resp. <code>coefmap</code>). In <code>basismap</code> (resp. <code>coefmap</code>), adding a track <code>:basis</code> to <code>annCol</code> (resp. <code>annRow</code>) makes the column (resp. row) corresponding to the component being also highlighted using the matching colours.
<code>lab_row</code>	labels for the rows.
<code>lab_col</code>	labels for the columns.
<code>...</code>	other parameters passing to <code>NMF::consensusmap()</code> .

Value

nothing

show_sig_exposure	<i>Plot Signature Exposure</i>
-------------------	--------------------------------

Description

Currently support copy number signatures and mutational signatures.

Usage

```
show_sig_exposure(
  Signature,
  sig_names = NULL,
  groups = NULL,
  grp_order = NULL,
  grp_size = NULL,
  cutoff = NULL,
  style = c("default", "cosmic"),
  palette = use_color_style(style),
  base_size = 12,
  font_scale = 1,
  rm_space = FALSE,
  rm_grid_line = TRUE,
  rm_panel_border = FALSE,
  hide_samps = TRUE,
  legend_position = "top"
)
```

Arguments

Signature	a Signature object obtained either from sig_extract or sig_auto_extract , or just a raw absolute exposure matrix with column representing samples (patients) and row representing signatures (signature names must end with different digital numbers, e.g. Sig1, Sig10, x12). If you named signatures with letters, you can specify them by sig_names parameter.
sig_names	set name of signatures, can be a character vector.
groups	sample groups, default is NULL.
grp_order	order of groups, default is NULL.
grp_size	font size of groups.
cutoff	a cutoff value to remove hyper-mutated samples.
style	plot style, one of 'default' and 'cosmic', works when parameter set_gradient_color is FALSE.

palette	palette used to plot, default use a built-in palette according to parameter style.
base_size	overall font size.
font_scale	a number used to set font scale.
rm_space	default is FALSE. If TRUE, it will remove border color and expand the bar width to 1. This is useful when the sample size is big.
rm_grid_line	default is FALSE, if TRUE, remove grid lines of plot.
rm_panel_border	default is TRUE for style 'cosmic', remove panel border to keep plot tight.
hide_samps	if TRUE, hide sample names.
legend_position	position of legend, default is 'top'.

Value

a ggplot object

p2
```

show_sig_feature_corrplot

Draw Corrplot for Signature Exposures and Other Features

Description

This function is for association visualization. Of note, the parameters `p_val` and `drop` will affect the visualization of association results under p value threshold.

Usage

```
show_sig_feature_corrplot(
  tidy_cor,
  feature_list,
  sort_features = FALSE,
  sig_orders = NULL,
  drop = TRUE,
  return_plotlist = FALSE,
  p_val = 0.05,
  xlab = "Signatures",
  ylab = "Features",
  co_gradient_colors = scale_color_gradient2(low = "blue", mid = "white", high = "red",
  midpoint = 0),
  ca_gradient_colors = co_gradient_colors,
  plot_ratio = "auto",
  breaks_count = c(0L, 200L, 400L, 600L, 800L, 1020L)
)
```

Arguments

<code>tidy_cor</code>	data returned by get_tidy_association .
<code>feature_list</code>	a character vector contains features want to be plotted. If missing, all features will be used.
<code>sort_features</code>	default is FALSE, use feature order obtained from the previous step. If TRUE, sort features as <code>feature_list</code> .
<code>sig_orders</code>	signature levels for ordering.
<code>drop</code>	if TRUE, when a feature has no association with all signatures (p value larger than threshold set by <code>p_val</code>), this feature will be removed from the plot. Otherwise, this feature (a row) will keep with all blank white.
<code>return_plotlist</code>	if TRUE, return as a list of ggplot objects.
<code>p_val</code>	p value threshold. If p value larger than this threshold, the result becomes blank white.
<code>xlab</code>	label for x axis.
<code>ylab</code>	label for y axis.
<code>co_gradient_colors</code>	a Scale object representing gradient colors used to plot for continuous features.
<code>ca_gradient_colors</code>	a Scale object representing gradient colors used to plot for categorical features.
<code>plot_ratio</code>	a length-2 numeric vector to set the height/width ratio.
<code>breaks_count</code>	breaks for sample count. If set it to NULL, ggplot bin scale will be used to automatically determine the breaks. If set it to NA, aes for sample will be not used.

Value

a ggplot2 object

))

p <- show_sig_feature_corrplot(tidy_data.seqz.feature, p_val = 0.05)
p
```

show_sig_fit

Show Signature Fit Result

Description

See [sig_fit](#) for examples.

Usage

```
show_sig_fit(
  fit_result,
  samples = NULL,
  signatures = NULL,
  plot_fun = c("boxplot", "violin", "scatter"),
  palette = "aaas",
  title = NULL,
  xlab = FALSE,
  ylab = "Signature exposure",
  legend = "none",
  width = 0.3,
  outlier.shape = NA,
  add = "jitter",
  add.params = list(alpha = 0.3),
  ...
)
```

Arguments

<code>fit_result</code>	result object from sig_fit .
<code>samples</code>	samples to show, if NULL, all samples are used.
<code>signatures</code>	signatures to show.
<code>plot_fun</code>	set the plot function.
<code>palette</code>	the color palette to be used for coloring or filling by groups. Allowed values include "grey" for grey color palettes; brewer palettes e.g. "RdBu", "Blues", ...; or custom color palette e.g. <code>c("blue", "red")</code> ; and scientific journal palettes from ggsci R package, e.g.: "npg", "aaas", "lancet", "jco", "ucscgb", "uchicago", "simpsons" and "rickandmorty".
<code>title</code>	plot main title.
<code>xlab</code>	character vector specifying x axis labels. Use <code>xlab = FALSE</code> to hide xlab.
<code>ylab</code>	character vector specifying y axis labels. Use <code>ylab = FALSE</code> to hide ylab.
<code>legend</code>	character specifying legend position. Allowed values are one of <code>c("top", "bottom", "left", "right", "none")</code> . To remove the legend use <code>legend = "none"</code> . Legend position can be also specified using a numeric vector <code>c(x, y)</code> ; see details section.
<code>width</code>	numeric value between 0 and 1 specifying box width.
<code>outlier.shape</code>	point shape of outlier. Default is 19. To hide outlier, specify <code>outlier.shape = NA</code> . When jitter is added, then outliers will be automatically hidden.
<code>add</code>	character vector for adding another plot element (e.g.: dot plot or error bars). Allowed values are one or the combination of: "none", "dotplot", "jitter", "boxplot", "point", "mean", "mean_se", "mean_sd", "mean_ci", "mean_range", "median", "median_iqr", "median_hilow", "median_q1q3", "median_mad", "median_range"; see <code>?desc_statby</code> for more details.
<code>add.params</code>	parameters (color, shape, size, fill, linetype) for the argument 'add'; e.g.: <code>add.params = list(color = "red")</code> .
<code>...</code>	other arguments to be passed to geom_boxplot , ggpar and facet .

Value

a ggplot object.

`show_sig_number_survey`*Show Simplified Signature Number Survey*

Description

`sig_estimate` shows comprehensive rank survey generated by **NMF** package, sometimes it is hard to consider all measures. Here provides a one or two y-axis visualization method to help users determine the optimal signature number (showing both stability ("cophenetic") and error (RSS) at default). Users can also set custom measures to show.

Usage

```
show_sig_number_survey(  
  object,  
  x = "rank",  
  left_y = "cophenetic",  
  right_y = "rss",  
  left_name = left_y,  
  right_name = toupper(right_y),  
  left_color = "black",  
  right_color = "red",  
  left_shape = 16,  
  right_shape = 18,  
  shape_size = 4  
)
```

Arguments

<code>object</code>	a Survey object generated from <code>sig_estimate</code> , or a <code>data.frame</code> contains at least rank columns and columns for one measure.
<code>x</code>	column name for x axis.
<code>left_y</code>	column name for left y axis.
<code>right_y</code>	column name for right y axis.
<code>left_name</code>	label name for left y axis.
<code>right_name</code>	label name for right y axis.
<code>left_color</code>	color for left axis.
<code>right_color</code>	color for right axis.
<code>left_shape, right_shape, shape_size</code>	shape setting.

Value

a ggplot object

See Also

[sig_estimate](#) for estimating signature number for [sig_extract](#), [show_sig_number_survey2](#) for more visualization method.

Examples

```
load(system.file("extdata", "toy_copynumber_tally_M.RData",
  package = "sigminer", mustWork = TRUE
))
library(NMF)
cn_estimate <- sig_estimate(cn_tally_M$nmf_matrix,
  cores = 1, nrun = 5,
  verbose = TRUE
)

# Show two measures
show_sig_number_survey(cn_estimate)
# Show one measure
p <- show_sig_number_survey(cn_estimate, right_y = NULL)
p
p <- add_h_arrow(p, x = 4.1, y = 0.953, label = "selected number")
p

# Show data from a data.frame
show_sig_number_survey(cn_estimate$survey)
# Show other measures
head(cn_estimate$survey)
show_sig_number_survey(cn_estimate$survey,
  right_y = "dispersion",
  right_name = "dispersion"
)
show_sig_number_survey(cn_estimate$survey,
  right_y = "evar",
  right_name = "evar"
)
```

show_sig_number_survey2

Show Comprehensive Signature Number Survey

Description

This function is modified from **NMF** package to better help users to explore survey of signature number.

Usage

```
show_sig_number_survey2(
  x,
  y = NULL,
  what = c("all", "cophenetic", "rss", "residuals", "dispersion", "evar", "sparseness",
    "sparseness.basis", "sparseness.coef", "silhouette", "silhouette.coef",
    "silhouette.basis", "silhouette.consensus"),
  na.rm = FALSE,
  xlab = "Number of signature",
  ylab = "",
  main = "Signature number survey using NMF package"
)
```

Arguments

x	a data.frame or NMF.rank object obtained from sig_estimate() .
y	for random simulation, a data.frame or NMF.rank object obtained from sig_estimate() .
what	a character vector whose elements partially match one of the following item, which correspond to the measures computed by <code>summary()</code> on each – multi-run – NMF result: 'all', 'cophenetic', 'rss', 'residuals', 'dispersion', 'evar', 'silhouette' (and more specific *.coef, *.basis, *.consensus), 'sparseness' (and more specific *.coef, *.basis). It specifies which measure must be plotted (what='all' plots all the measures).
na.rm	single logical that specifies if the rank for which the measures are NA values should be removed from the graph or not (default to FALSE). This is useful when plotting results which include NAs due to error during the estimation process. See argument stop for <code>nmfEstimateRank</code> .
xlab	x-axis label
ylab	y-axis label
main	main title

Value

a ggplot object

Examples

```
load(system.file("extdata", "toy_copynumber_tally_M.RData",
  package = "sigminer", mustWork = TRUE
))
library(NMF)
cn_estimate <- sig_estimate(cn_tally_M$nmf_matrix,
  cores = 1, nrun = 5,
  verbose = TRUE,
  keep_nmfObj = TRUE
)
```

```
# Show from data.frame obtained by sig_estimate()
show_sig_number_survey2(cn_estimate$survey)
show_sig_number_survey2(cn_estimate$survey, y = cn_estimate$survey.random)

# Show directly from NMF.rank object
show_sig_number_survey2(cn_estimate$nmfEstimate)
show_sig_number_survey2(cn_estimate$nmfEstimate, y = cn_estimate$nmfEstimate.random)
```

show_sig_profile *Show Signature Profile*

Description

Who don't like to show a barplot for signature profile? This is for it.

Usage

```
show_sig_profile(
  Signature,
  mode = c("SBS", "copynumber", "DBS", "ID", "RS"),
  method = "Wang",
  normalize = c("row", "column", "raw", "feature"),
  y_tr = NULL,
  filters = NULL,
  feature_setting = sigminer::CN.features,
  style = c("default", "cosmic"),
  palette = use_color_style(style, mode, method),
  set_gradient_color = FALSE,
  free_space = "free_x",
  rm_panel_border = style == "cosmic",
  rm_grid_line = style == "cosmic",
  rm_axis_text = FALSE,
  bar_border_color = ifelse(style == "default", "grey50", "white"),
  bar_width = 0.7,
  paint_axis_text = TRUE,
  x_label_angle = ifelse(mode == "copynumber" & !(startsWith(method, "T") | method ==
    "X"), 60, 90),
  x_label_vjust = ifelse(mode == "copynumber" & !(startsWith(method, "T") | method ==
    "X"), 1, 0.5),
  x_label_hjust = 1,
  x_lab = "Components",
  y_lab = "auto",
  params = NULL,
  show_cv = FALSE,
  params_label_size = 3,
  params_label_angle = 60,
  y_expand = 1,
```

```

    digits = 2,
    base_size = 12,
    font_scale = 1,
    sig_names = NULL,
    sig_orders = NULL,
    check_sig_names = TRUE
)

```

Arguments

Signature	a Signature object obtained either from <code>sig_extract</code> or <code>sig_auto_extract</code> , or just a raw signature matrix with row representing components (motifs) and column representing signatures (column names must start with 'Sig').
mode	signature type for plotting, now supports 'copynumber', 'SBS', 'DBS', 'ID' and 'RS' (genome rearrangement signature).
method	method for copy number feature classification in <code>sig_tally</code> , can be one of "Macintyre" ("M"), "Wang" ("W").
normalize	one of 'row', 'column', 'raw' and "feature", for row normalization (signature), column normalization (component), raw data, row normalization by feature, respectively. Of note, 'feature' only works when the mode is 'copynumber'.
y_tr	a function (e.g. \log_{10}) to transform y axis before plotting.
filters	a pattern used to select components to plot.
feature_setting	a data.frame used for classification. Only used when method is "Wang" ("W"). Default is <code>CN.features</code> . Users can also set custom input with "feature", "min" and "max" columns available. Valid features can be printed by <code>unique(CN.features\$feature)</code> .
style	plot style, one of 'default' and 'cosmic', works when parameter <code>set_gradient_color</code> is FALSE.
palette	palette used to plot when <code>set_gradient_color</code> is FALSE, default use a built-in palette according to parameter style.
set_gradient_color	default is FALSE, if TRUE, use gradient colors to fill bars. This is very useful when signatures are extracted from "Macintyre" method and normalize is 'column'.
free_space	default is 'free_x'. If "fixed", all panels have the same size. If "free_y" their height will be proportional to the length of the y scale; if "free_x" their width will be proportional to the length of the x scale; or if "free" both height and width will vary. This setting has no effect unless the appropriate scales also vary.
rm_panel_border	default is TRUE for style 'cosmic', remove panel border to keep plot tight.
rm_grid_line	default is FALSE, if TRUE, remove grid lines of plot.
rm_axis_text	default is FALSE, if TRUE, remove component texts. This is useful when multiple signature profiles are plotted together.

bar_border_color	the color of bar border.
bar_width	bar width. By default, set to 70% of the resolution of the data.
paint_axis_text	if TRUE, color on text of x axis.
x_label_angle	font angle for x label.
x_label_vjust	font vjust for x label.
x_label_hjust	font hjust for x label.
x_lab	x axis lab.
y_lab	y axis lab.
params	params data.frame of components, obtained from sig_tally .
show_cv	default is FALSE, if TRUE, show coefficient of variation when params is not NULL.
params_label_size	font size for params label.
params_label_angle	font angle for params label.
y_expand	y expand height for plotting params of copy number signatures.
digits	digits for plotting params of copy number signatures.
base_size	overall font size.
font_scale	a number used to set font scale.
sig_names	set name of signatures, can be a character vector. Default is NULL, prefix 'Sig' plus number is used.
sig_orders	set order of signatures, can be a character vector. Default is NULL, the signatures are ordered by alphabetical order. If an integer vector set, only specified signatures are plotted.
check_sig_names	if TRUE, check signature names when input is a matrix, i.e., all signatures (col-names) must start with 'Sig'.

Value

a ggplot object

Show Signature Profile with Heatmap

Description

This is a complementary function to [show_sig_profile\(\)](#), it is used for visualizing some big signatures, i.e. SBS-1536, not all signatures are supported. See details for current supported signatures.

Usage

```

show_sig_profile_heatmap(
  Signature,
  mode = c("SBS", "DBS"),
  normalize = c("row", "column", "raw"),
  filters = NULL,
  x_lab = NULL,
  y_lab = NULL,
  legend_name = "auto",
  palette = "red",
  x_label_angle = 90,
  x_label_vjust = 1,
  x_label_hjust = 0.5,
  y_label_angle = 0,
  y_label_vjust = 0.5,
  y_label_hjust = 1,
  flip_xy = FALSE,
  sig_names = NULL,
  sig_orders = NULL,
  check_sig_names = TRUE
)

```

Arguments

Signature	a Signature object obtained either from sig_extract or sig_auto_extract , or just a raw signature matrix with row representing components (motifs) and column representing signatures (column names must start with 'Sig').
-----------	---

mode	one of "SBS" and "DBS".
normalize	one of 'row', 'column', 'raw' and "feature", for row normalization (signature), column normalization (component), raw data, row normalization by feature, respectively. Of note, 'feature' only works when the mode is 'copynumber'.
filters	a pattern used to select components to plot.
x_lab	x label.
y_lab	y label.
legend_name	name of figure legend.
palette	color for value.
x_label_angle	angle for x axis text.
x_label_vjust	vjust for x axis text.
x_label_hjust	hjust for x axis text.
y_label_angle	angle for y axis text.
y_label_vjust	vjust for y axis text.
y_label_hjust	hjust for y axis text.
flip_xy	if TRUE, flip x axis and y axis.
sig_names	set name of signatures, can be a character vector. Default is NULL, prefix 'Sig' plus number is used.
sig_orders	set order of signatures, can be a character vector. Default is NULL, the signatures are ordered by alphabetical order. If an integer vector set, only specified signatures are plotted.
check_sig_names	if TRUE, check signature names when input is a matrix, i.e., all signatures (col-names) must start with 'Sig'.

Details

Support:

- SBS-24
- SBS-96
- SBS-384
- SBS-1536
- SBS-6144
- DBS-78
- DBS-186

Value

a ggplot object.

Examples

```
# Load SBS signature
load(system.file("extdata", "toy_mutational_signature.RData",
  package = "sigminer", mustWork = TRUE
))
# Show signature profile
p1 <- show_sig_profile_heatmap(sig2, mode = "SBS")
p1
```

show_sig_profile_loop *Show Signature Profile with Loop Way*

Description

Show Signature Profile with Loop Way

Usage

```
show_sig_profile_loop(
  Signature,
  sig_names = NULL,
  ncol = 1,
  nrow = NULL,
  x_lab = "Components",
  ...
)
```

Arguments

Signature	a Signature object obtained either from sig_extract or sig_auto_extract , or just a raw signature matrix with row representing components (motifs) and column representing signatures (column names must start with 'Sig').
sig_names	set name of signatures, can be a character vector. Default is NULL, prefix 'Sig' plus number is used.
ncol	(optional) Number of columns in the plot grid.
nrow	(optional) Number of rows in the plot grid.
x_lab	x axis lab.
...	other parameters but sig_order passing to show_sig_profile .

Value

a ggplot result from `cowplot::plot_grid()`.

- Result visualization for [MAF](#) is provide by **maftools** package, please read its [vignette](#).

sigprofiler	<i>Extract Signatures with SigProfiler</i>
-------------	--

Description

This function provides an interface to software SigProfiler. More please see <https://github.com/AlexandrovLab/SigProfilerExtractor>. Typically, a reference genome is not required because the input is a matrix (my understanding).

Usage

```
sigprofiler_extract(
  nmf_matrix,
  output,
  range = 2:5,
  nrun = 10L,
  refit = FALSE,
  refit_plot = FALSE,
  is_exome = FALSE,
  init_method = c("nndsvd_min", "random", "alexandrov-lab-custom", "nndsvd", "nndslda",
    "nndsldar"),
  cores = -1L,
```

```

genome_build = c("hg19", "hg38", "mm10"),
use_conda = FALSE,
py_path = NULL,
sigprofiler_version = "1.0.17"
)

sigprofiler_import(
  output,
  order_by_expo = FALSE,
  type = c("suggest", "refit", "all")
)

```

Arguments

<code>nmf_matrix</code>	a matrix used for NMF decomposition with rows indicate samples and columns indicate components.
<code>output</code>	output directory.
<code>range</code>	signature number range, i.e. 2:5.
<code>nrun</code>	the number of iteration to be performed to extract each signature number.
<code>refit</code>	if TRUE, then refit the denovo signatures with nnls. Same meaning as optimize option in sig_extract or sig_auto_extract .
<code>refit_plot</code>	if TRUE, SigProfiler will make denovo to COSMIC sigantures decomposition plots. However, this may fail due to some matrix cannot be identified by Sig-Profiler plot program.
<code>is_exome</code>	if TRUE, the exomes will be extracted.
<code>init_method</code>	the initialization algorithm for W and H matrix of NMF. Options are 'random', 'nndsvd', 'nndsvda', 'nndsvdar', 'alexandrov-lab-custom' and 'nndsvd_min'.
<code>cores</code>	number of cores used for computation.
<code>genome_build</code>	I think this option is useless when input is matrix, keep it in case it is useful.
<code>use_conda</code>	if TRUE, create an independent conda environment to run SigProfiler.
<code>py_path</code>	path to Python executable file, e.g. '/Users/wsx/anaconda3/bin/python'.
<code>sigprofiler_version</code>	version of SigProfilerExtractor. If this package is not installed, the specified package will be installed. If this package is installed, this option is useless.
<code>order_by_expo</code>	if TRUE, order the import signatures by their exposures, e.g. the signature contributed the most exposure in all samples will be named as Sig1.
<code>type</code>	one of 'suggest' (for suggested solution), 'refit' (for refit solution) or 'all' (for all solutions).

Value

For `sigprofiler_extract()`, returns nothing. See output directory.

For `sigprofiler_import()`, a list containing Signature object.

Examples

```

if (FALSE) {
  load(system.file("extdata", "toy_copynumber_tally_M.RData",
    package = "sigminer", mustWork = TRUE
  ))

  reticulate::conda_list()

  sigprofiler_extract(cn_tally_M$nmf_matrix, "~/test/test_sigminer",
    use_conda = TRUE
  )

  sigprofiler_extract(cn_tally_M$nmf_matrix, "~/test/test_sigminer",
    use_conda = FALSE, py_path = "/Users/wsx/anaconda3/bin/python"
  )
}

```

sig_auto_extract	<i>Extract Signatures through the Automatic Relevance Determination Technique</i>
------------------	---

Description

A bayesian variant of NMF algorithm to enable optimal inferences for the number of signatures through the automatic relevance determination technique. This functions delivers highly interpretable and sparse representations for both signature profiles and attributions at a balance between data fitting and model complexity (this method may introduce more signatures than expected, especially for copy number signatures (thus **I don't recommend you to use this feature to extract copy number signatures**)). See detail part and references for more.

Usage

```

sig_auto_extract(
  nmf_matrix = NULL,
  result_prefix = "BayesNMF",
  destdir = tempdir(),
  method = c("L1W.L2H", "L1KL", "L2KL"),
  strategy = c("stable", "optimal", "ms"),
  ref_sigs = NULL,
  K0 = 25,
  nrun = 10,
  niter = 2e+05,
  tol = 1e-07,
  cores = 1,
  optimize = FALSE,
  skip = FALSE,
  recover = FALSE
)

```

Arguments

nmf_matrix	a matrix used for NMF decomposition with rows indicate samples and columns indicate components.
result_prefix	prefix for result data files.
destdir	path to save data runs, default is tempdir().
method	default is "L1W.L2H", which uses an exponential prior for W and a half-normal prior for H (This method is used by PCAWG project, see reference #3). You can also use "L1KL" to set exponential priors for both W and H, and "L2KL" to set half-normal priors for both W and H. The latter two methods are originally implemented by SignatureAnalyzer software .
strategy	the selection strategy for returned data. Set 'stable' for getting optimal result from the most frequent K. Set 'optimal' for getting optimal result from all Ks. Set 'ms' for getting result with maximum mean cosine similarity with provided reference signatures. See ref_sigs option for details. If you want select other solution, please check get_bayesian_result .
ref_sigs	A Signature object or matrix or string for specifying reference signatures, only used when strategy = 'ms'. See Signature and sig_db options in get_sig_similarity for details.
K0	number of initial signatures.
nrun	number of independent simulations.
niter	the maximum number of iterations.
tol	tolerance for convergence.
cores	number of cpu cores to run NMF.
optimize	if TRUE, then refit the denovo signatures with QP method, see sig_fit .
skip	if TRUE, it will skip running a previous stored result. This can be used to extend run times, e.g. you try running 10 times firstly and then you want to extend it to 20 times.
recover	if TRUE, try to recover result from previous runs based on input result_prefix, destdir and nrun. This is pretty useful for reproducing result. Please use skip if you want to recover an unfinished job.

Details

There are three methods available in this function: "L1W.L2H", "L1KL" and "L2KL". They use different priors for the bayesian variant of NMF algorithm (see method parameter) written by reference #1 and implemented in [SignatureAnalyzer software](#) (reference #2).

I copied source code for the three methods from Broad Institute and supplementary files of reference #3, and wrote this higher function. It is more friendly for users to extract, visualize and analyze signatures by combining with other powerful functions in **sigminer** package. Besides, I implemented parallel computation to speed up the calculation process and a similar input and output structure like [sig_extract\(\)](#).

Value

a list with Signature class.

  strategy = "ms", nrun = 3, ref_sigs = "legacy"
)
x
```

sig_convert

Convert Signatures between different Genomic Distribution of Components

Description

Converts signatures between two representations relative to different sets of mutational opportunities. Currently, only SBS signature is supported.

Usage

```
sig_convert(sig, from = "human-genome", to = "human-exome")
```

Arguments

sig	a Signature object obtained either from sig_extract or sig_auto_extract , or just a raw signature matrix/data.frame with row representing components (motifs) and column representing signatures.
from	either one of "human-genome" and "human-exome" or an opportunity matrix (repeated n columns with each row represents the total number of mutations for a component, n is the number of signature).
to	same as from.

Details

The default opportunity matrix for "human-genome" and "human-exome" comes from COSMIC signature database v2 and v3.

Value

a matrix.

References

convert_signatures function from sigfit package.

Examples

```
# Load SBS signature
load(system.file("extdata", "toy_mutational_signature.RData",
  package = "sigminer", mustWork = TRUE
))
# Exome-relative to Genome-relative
sig_converted <- sig_convert(sig2,
  from = "human-exome",
  to = "human-genome"
)
sig_converted

show_sig_profile(sig2, style = "cosmic")
show_sig_profile(sig_converted, style = "cosmic")
```

sig_estimate	<i>Estimate Signature Number</i>
--------------	----------------------------------

Description

Use **NMF** package to evaluate the optimal number of signatures. This is used along with [sig_extract](#). Users should `library(NMF)` firstly. If NMF objects are returned, the result can be further visualized by NMF plot methods like `NMF::consensusmap()` and `NMF::basismap()`.

Usage

```
sig_estimate(
  nmf_matrix,
  range = 2:5,
  nrun = 10,
  use_random = FALSE,
  method = "brunet",
  seed = 123456,
  cores = 1,
  keep_nmfObj = FALSE,
  save_plots = FALSE,
  plot_basename = file.path(tempdir(), "nmf"),
  what = "all",
  pConstant = NULL,
  verbose = FALSE
)
```

Arguments

<code>nmf_matrix</code>	a matrix used for NMF decomposition with rows indicate samples and columns indicate components.
<code>range</code>	a numeric vector containing the ranks of factorization to try. Note that duplicates are removed and values are sorted in increasing order. The results are notably returned in this order.
<code>nrun</code>	a numeric giving the number of run to perform for each value in range, nrun set to 30~50 is enough to achieve robust result.
<code>use_random</code>	Should generate random data from input to test measurements. Default is TRUE.
<code>method</code>	specification of the NMF algorithm. Use 'brunet' as default. Available methods for nmf decompositions are 'brunet', 'lee', 'ls-nmf', 'nsNMF', 'offset'.
<code>seed</code>	specification of the starting point or seeding method, which will compute a starting point, usually using data from the target matrix in order to provide a good guess.
<code>cores</code>	number of cpu cores to run NMF.
<code>keep_nmfObj</code>	default is FALSE, if TRUE, keep NMF objects from runs, and the result may be huge.

save_plots	if TRUE, save signature number survey plot to local machine.
plot_basename	when save plots, set custom basename for file path.
what	a character vector whose elements partially match one of the following item, which correspond to the measures computed by summary on each multi-run NMF result: 'all', 'cophenetic', 'rss', 'residuals', 'dispersion', 'evar', 'silhouette' (and more specific .coef, .basis, .consensus), 'sparseness' (and more specific .coef, .basis). It specifies which measure must be plotted (what='all' plots all the measures).
pConstant	A small positive value (like 1e-9) to add to the matrix. Use it ONLY if the functions throws an non-conformable arrays error.
verbose	if TRUE, print extra message.

Details

The most common approach is to choose the smallest rank for which cophenetic correlation coefficient starts decreasing (Used by this function). Another approach is to choose the rank for which the plot of the residual sum of squares (RSS) between the input matrix and its estimate shows an inflection point. More custom features please directly use [NMF::nmfEstimateRank](#).

Value

a list contains information of NMF run and rank survey.

Examples

```
load(system.file("extdata", "toy_copynumber_tally_M.RData",
  package = "sigminer", mustWork = TRUE
))
## Not run:
library(NMF)
cn_estimate <- sig_estimate(cn_tally_M$nmf_matrix,
  cores = 1, nrun = 5,
  verbose = TRUE
)

## End(Not run)
```

sig_extract *Extract Signatures through NMF*

Description

Do NMF de-composition and then extract signatures.

Usage

```
sig_extract(
  nmf_matrix,
  n_sig,
  nrun = 10,
  cores = 1,
  method = "brunet",
  optimize = FALSE,
  pConstant = NULL,
  seed = 123456,
  ...
)
```

Arguments

nmf_matrix	a matrix used for NMF decomposition with rows indicate samples and columns indicate components.
n_sig	number of signature. Please run sig_estimate to select a suitable value.
nrun	a numeric giving the number of run to perform for each value in range, nrun set to 30~50 is enough to achieve robust result.
cores	number of cpu cores to run NMF.
method	specification of the NMF algorithm. Use 'brunet' as default. Available methods for nmf decompositions are 'brunet', 'lee', 'ls-nmf', 'nsNMF', 'offset'.
optimize	if TRUE, then refit the denovo signatures with QP method, see sig_fit .
pConstant	A small positive value (like 1e-9) to add to the matrix. Use it ONLY if the functions throws an non-conformable arrays error.
seed	specification of the starting point or seeding method, which will compute a starting point, usually using data from the target matrix in order to provide a good guess.
...	other arguments passed to <code>NMF::nmf()</code> .

Value

a list with Signature class.

[sig_tally](#) for getting variation matrix, [sig_estimate](#) for estimating signature number for [sig_extract](#), [sig_auto_extract](#) for extracting signatures using automatic relevance determination technique.

Examples

```
load(system.file("extdata", "toy_copynumber_tally_M.RData",
  package = "sigminer", mustWork = TRUE
))
# Extract copy number signatures
library(NMF)
res <- sig_extract(cn_tally_M$nmf_matrix, 2, nrun = 1)
```

sig_fit

Fit Signature Exposures with Linear Combination Decomposition

Description

The function performs a signatures decomposition of a given mutational catalogue V with known signatures W by solving the minimization problem $\min(\|W*H - V\|)$ where W and V are known.

Usage

```
sig_fit(
  catalogue_matrix,
  sig,
  sig_index = NULL,
  sig_db = "legacy",
  db_type = c("", "human-exome", "human-genome"),
  show_index = TRUE,
  method = c("QP", "NNLS", "SA"),
  auto_reduce = FALSE,
  type = c("absolute", "relative"),
  return_class = c("matrix", "data.table"),
  return_error = FALSE,
  rel_threshold = 0,
  mode = c("SBS", "DBS", "ID", "copynumber"),
  true_catalog = NULL,
  ...
)
```

Arguments

catalogue_matrix	a numeric matrix V with row representing components and columns representing samples, typically you can get <code>nmf_matrix</code> from <code>sig_tally()</code> and transpose it by <code>t()</code> .
sig	a Signature object obtained either from <code>sig_extract</code> or <code>sig_auto_extract</code> , or just a raw signature matrix/data.frame with row representing components (motifs) and column representing signatures.
sig_index	a vector for signature index. "ALL" for all signatures.
sig_db	default 'legacy', it can be 'legacy' (for COSMIC v2 'SBS'), 'SBS', 'DBS', 'ID' and 'TSB' (for COSMIV v3.1 signatures). For more specific details, it can also be 'SBS_hg19', 'SBS_hg38', 'SBS_mm9', 'SBS_mm10', 'DBS_hg19', 'DBS_hg38', 'DBS_mm9', 'DBS_mm10' to use COSMIC v3 reference signatures from Alexandrov, Ludmil B., et al. (2020) (reference #1). In addition, it can be one of "SBS_Nik_lab_Organ", "RS_Nik_lab_Organ", "SBS_Nik_lab", "RS_Nik_lab" to refer reference signatures from Degasperi, Andrea, et al. (2020) (reference #2). Note: the signature profile for different genome builds are basically same. And specific database (e.g. 'SBS_mm10') contains less signatures than all COSMIC signatures (because some signatures are not detected from Alexandrov, Ludmil B., et al. (2020)).
db_type	only used when sig_db is enabled. "" for keeping default, "human-exome" for transforming to exome frequency of component, and "human-genome" for transforming to whole genome frequency of component. Currently only works for 'SBS'.
show_index	if TRUE, show valid indices.
method	method to solve the minimization problem. 'NNLS' for non-negative least square; 'QP' for quadratic programming; 'SA' for simulated annealing.
auto_reduce	if TRUE, try reducing the input reference signatures to increase the cosine similarity of reconstructed profile to observed profile.
type	'absolute' for signature exposure and 'relative' for signature relative exposure.
return_class	string, 'matrix' or 'data.table'.
return_error	if TRUE, also return sample error (Frobenius norm) and cosine similarity between observed sample profile (asa. spectrum) and reconstructed profile. NOTE: it is better to obtain the error when the type is 'absolute', because the error is affected by relative exposure accuracy.
rel_threshold	numeric vector, a signature with relative exposure lower than (equal is included, i.e. \leq) this value will be set to 0 (both absolute exposure and relative exposure). In this case, sum of signature contribution may not equal to 1.
mode	signature type for plotting, now supports 'copynumber', 'SBS', 'DBS', 'ID' and 'RS' (genome rearrangement signature).
true_catalog	used by <code>sig_fit_bootstrap</code> , user never use it.
...	control parameters passing to argument control in GenSA function when use method 'SA'.

Details

The method 'NNLS' solves the minimization problem with nonnegative least-squares constraints. The method 'QP' and 'SA' are modified from SignatureEstimation package. See references for details. Of note, when fitting exposures for copy number signatures, only components of feature CN is used.

Value

The exposure result either in matrix or data.table format. If return_error set TRUE, a list is returned.

sig_fit_bootstrap	<i>Obtain Bootstrap Distribution of Signature Exposures of a Certain Tumor Sample</i>
-------------------	---

Description

This can be used to obtain the confidence of signature exposures or search the suboptimal decomposition solution.

Usage

```

sig_fit_bootstrap(
  catalog,
  sig,
  n = 100L,
  sig_index = NULL,
  sig_db = "legacy",
  db_type = c("", "human-exome", "human-genome"),
  show_index = TRUE,
  method = c("QP", "NNLS", "SA"),
  auto_reduce = FALSE,
  SA_not_bootstrap = FALSE,
  type = c("absolute", "relative"),
  rel_threshold = 0,
  mode = c("SBS", "DBS", "ID", "copynumber"),
  find_suboptimal = FALSE,
  suboptimal_ref_error = NULL,
  suboptimal_factor = 1.05,
  ...
)

```

Arguments

catalog	a named numeric vector or a numeric matrix with dimension Nx1. N is the number of component, 1 is the sample.
sig	a Signature object obtained either from sig_extract or sig_auto_extract , or just a raw signature matrix/data.frame with row representing components (motifs) and column representing signatures.
n	the number of bootstrap replicates.
sig_index	a vector for signature index. "ALL" for all signatures.

sig_db	default 'legacy', it can be 'legacy' (for COSMIC v2 'SBS'), 'SBS', 'DBS', 'ID' and 'TSB' (for COSMIV v3.1 signatures). For more specific details, it can also be 'SBS_hg19', 'SBS_hg38', 'SBS_mm9', 'SBS_mm10', 'DBS_hg19', 'DBS_hg38', 'DBS_mm9', 'DBS_mm10' to use COSMIC v3 reference signatures from Alexandrov, Ludmil B., et al. (2020) (reference #1). In addition, it can be one of "SBS_Nik_lab_Organ", "RS_Nik_lab_Organ", "SBS_Nik_lab", "RS_Nik_lab" to refer reference signatures from Degasperi, Andrea, et al. (2020) (reference #2). Note: the signature profile for different genome builds are basically same. And specific database (e.g. 'SBS_mm10') contains less signatures than all COSMIC signatures (because some signatures are not detected from Alexandrov, Ludmil B., et al. (2020)).
db_type	only used when sig_db is enabled. "" for keeping default, "human-exome" for transforming to exome frequency of component, and "human-genome" for transforming to whole genome frequency of component. Currently only works for 'SBS'.
show_index	if TRUE, show valid indices.
method	method to solve the minimization problem. 'NNLS' for non-negative least square; 'QP' for quadratic programming; 'SA' for simulated annealing.
auto_reduce	if TRUE, try reducing the input reference signatures to increase the cosine similarity of reconstructed profile to observed profile.
SA_not_bootstrap	if TRUE, directly run 'SA' multiple times with original input instead of bootstrap samples.
type	'absolute' for signature exposure and 'relative' for signature relative exposure.
rel_threshold	numeric vector, a signature with relative exposure lower than (equal is included, i.e. <=) this value will be set to 0 (both absolute exposure and relative exposure). In this case, sum of signature contribution may not equal to 1.
mode	signature type for plotting, now supports 'copynumber', 'SBS', 'DBS', 'ID' and 'RS' (genome rearrangement signature).
find_suboptimal	logical, if TRUE, find suboptimal decomposition with slightly higher error than the optimal solution by method 'SA'. This is useful to explore hidden dependencies between signatures. More see reference.
suboptimal_ref_error	baseline error used for finding suboptimal solution. if it is NULL, then use 'SA' method to obtain the optimal error.
suboptimal_factor	suboptimal factor to get suboptimal error, default is 1.05, i.e., suboptimal error is 1.05 times baseline error.
...	control parameters passing to argument control in GenSA function when use method 'SA'.

Value

a list

sig_fit_bootstrap_batch

Exposure Instability Analysis of Signature Exposures with Bootstrapping

Description

Read [sig_fit_bootstrap](#) for more option setting.

Usage

```
sig_fit_bootstrap_batch(
  catalogue_matrix,
  methods = c("QP"),
  n = 100L,
  min_count = 1L,
  p_val_thresholds = c(0.05),
  use_parallel = FALSE,
  seed = 123456L,
  job_id = NULL,
  result_dir = tempdir(),
  ...
)
```

Arguments

catalogue_matrix	a numeric matrix V with row representing components and columns representing samples, typically you can get <code>nmf_matrix</code> from <code>sig_tally()</code> and transpose it by <code>t()</code> .
methods	a subset of <code>c("NNLS", "QP", "SA")</code> .
n	the number of bootstrap replicates.
min_count	minimal exposure in a sample, default is 1. Any patient has total exposure less than this value will be filtered out.
p_val_thresholds	a vector of relative exposure threshold for calculating p values.
use_parallel	if TRUE, use parallel computation based on furrr package.
seed	random seed to reproduce the result.
job_id	a job ID, default is NULL, can be a string. When not NULL, all bootstrapped results will be saved to local machine location defined by <code>result_dir</code> . This is very useful for running more than 10 times for more than 100 samples.
result_dir	see above, default is temp directory defined by R.
...	other common parameters passing to sig_fit_bootstrap , including <code>sig</code> , <code>sig_index</code> , <code>sig_db</code> , <code>db_type</code> , <code>mode</code> , <code>auto_reduce</code> etc.

Value

a list of `data.table`.

W <- apply(W, 2, function(x) x / sum(x))

H <- matrix(c(2, 5, 3, 6, 1, 9, 1, 2), ncol = 4)
colnames(H) <- paste0("samp", 1:4)

V <- W %*% H
V

if (requireNamespace("quadprog")) {
  z10 <- sig_fit_bootstrap_batch(V, sig = W, n = 10)
  z10
}

```

sig_names

*Obtain or Modify Signature Information***Description**

Obtain or Modify Signature Information

Usage

```

sig_names(sig)

sig_modify_names(sig, new_names)

sig_number(sig)

sig_attrs(sig)

sig_signature(sig, normalize = c("row", "column", "raw", "feature"))

sig_exposure(sig, type = c("absolute", "relative"))

```

Arguments

sig	a Signature object obtained either from sig_extract or sig_auto_extract .
new_names	new signature names.
normalize	one of 'row', 'column', 'raw' and "feature", for row normalization (signature), column normalization (component), raw data, row normalization by feature, respectively.
type	one of 'absolute' and 'relative'.

Value

a Signature object or data.

Examples

```
## Operate signature names
load(system.file("extdata", "toy_mutational_signature.RData",
  package = "sigminer", mustWork = TRUE
))
sig_names(sig2)
cc <- sig_modify_names(sig2, new_names = c("Sig2", "Sig1", "Sig3"))
sig_names(cc)

# The older names are stored in tags.
print(attr(cc, "tag"))
## Get signature number
sig_number(sig2)
## Get signature attributes
sig_number(sig2)
## Get signature matrix
z <- sig_signature(sig2)
z <- sig_signature(sig2, normalize = "raw")
## Get exposure matrix
## Of note, this is different from get_sig_exposure()
## it returns a matrix instead of data table.
z <- sig_exposure(sig2) # it is same as sig$Exposure
z <- sig_exposure(sig2, type = "relative") # it is same as sig2$Exposure.norm
```

sig_tally

Tally a Genomic Alteration Object

Description

Tally a variation object like [MAF](#), [CopyNumber](#) and return a matrix for NMF de-composition and more. This is a generic function, so it can be further extended to other mutation cases. **Please read details about how to set sex for identifying copy number signatures.** Please read <https://osf.io/s93d5/> for the generation of SBS, DBS and ID (INDEL) components. **Of note, many options are designed for method "M" only, and they are highlighted by bold fonts** (you can ignore them if you don't use "M" method).

Usage

```
sig_tally(object, ...)

## S3 method for class 'CopyNumber'
sig_tally(
  object,
  method = "Wang",
```

```

    ignore_chrs = NULL,
    indices = NULL,
    add_loh = FALSE,
    feature_setting = sigminer::CN.features,
    type = c("probability", "count"),
    reference_components = FALSE,
    cores = 1,
    seed = 123456,
    min_comp = 2,
    max_comp = 15,
    min_prior = 0.001,
    model_selection = "BIC",
    threshold = 0.1,
    nrep = 1,
    niter = 1000,
    keep_only_matrix = FALSE,
    ...
)

## S3 method for class 'MAF'
sig_tally(
  object,
  mode = c("SBS", "DBS", "ID", "ALL"),
  ref_genome = "BSgenome.Hsapiens.UCSC.hg19",
  genome_build = NULL,
  add_trans_bias = FALSE,
  ignore_chrs = NULL,
  use_syn = TRUE,
  keep_only_matrix = FALSE,
  ...
)

```

Arguments

object	a CopyNumber object or MAF object.
...	custom setting for operating object. Detail see S3 method for corresponding class (e.g. CopyNumber).
method	method for feature classification, can be one of "Macintyre" ("M"), "Wang" ("W").
ignore_chrs	Chromosomes to ignore from analysis. e.g. chrX and chrY.
indices	integer vector indicating segments to keep.
add_loh	flag to add LOH classifications.
feature_setting	a data.frame used for classification. Only used when method is "Wang" ("W") . Default is CN.features . Users can also set custom input with "feature", "min" and "max" columns available. Valid features can be printed by <code>unique(CN.features\$feature)</code> .

type	one of "probability", "count". Default is "probability", return a matrix with the sum of posterior probabilities for each components. If set to 'count', return a matrix with event count assigned to each components. The result for both types should be close. Only used when method is "Macintyre" .
reference_components	default is FALSE, calculate mixture components from CopyNumber object. Only used when method is "Macintyre" .
cores	number of computer cores to run this task. You can use future::availableCores() function to check how many cores you can use.
seed	seed number. Only used when method is "Macintyre" .
min_comp	minimal number of components to fit, default is 2. Can also be a vector with length 6, which apply to each feature. Only used when method is "Macintyre" .
max_comp	maximal number of components to fit, default is 15. Can also be a vector with length 6, which apply to each feature. Only used when method is "Macintyre" .
min_prior	the minimum relative size of components, default is 0.001. Details about custom setting please refer to flexmix package. Only used when method is "Macintyre" .
model_selection	model selection strategy, default is 'BIC'. Details about custom setting please refer to flexmix package. Only used when method is "Macintyre" .
threshold	default is 0.1. Sometimes, the result components include adjacent distributions with similar mu (two and more distribution are very close), we use this threshold to obtain a more meaningful fit with less components. Only used when method is "Macintyre" .
nrep	number of run times for each value of component, keep only the solution with maximum likelihood. Only used when method is "Macintyre" .
niter	the maximum number of iterations. Only used when method is "Macintyre" .
keep_only_matrix	if TRUE, keep only matrix for signature extraction. For a MAF object, this will just return the most useful matrix.
mode	type of mutation matrix to extract, can be one of 'SBS', 'DBS' and 'ID'.
ref_genome	'BSgenome.Hsapiens.UCSC.hg19', 'BSgenome.Hsapiens.UCSC.hg38' and 'BSgenome.Mmusculus.UCSC.hg38' etc.
genome_build	genome build 'hg19', 'hg38' or "mm10", if not set, guess it by ref_genome.
add_trans_bias	if TRUE, consider transcriptional bias categories. 'T:' for Transcribed (the variant is on the transcribed strand); 'U:' for Un-transcribed (the variant is on the untranscribed strand); 'B:' for Bi-directional (the variant is on both strand and is transcribed either way); 'N:' for Non-transcribed (the variant is in a non-coding region and is untranslated); 'Q:' for Questionable. NOTE: the result counts of 'B' and 'N' labels are a little different from SigProfilerMatrixGenerator, the reason is unknown (may be caused by annotation file).
use_syn	Logical. If TRUE, include synonymous variants in analysis.

Details

For identifying copy number signatures, we have to derive copy number features firstly. Due to the difference of copy number values in sex chromosomes between male and female, we have to do an extra step **if we don't want to ignore them**.

I create two options to control this, the default values are shown as the following, you can use the same way to set (per R session).

```
options(sigminer.sex = "female", sigminer.copynumber.max = NA_integer_)
```

- If your cohort are all females, you can totally ignore this.
- If your cohort are all males, set `sigminer.sex` to 'male' and `sigminer.copynumber.max` to a proper value (the best is consistent with [read_copynumber](#)).
- If your cohort contains both males and females, set `sigminer.sex` as a `data.frame` with two columns "sample" and "sex". And set `sigminer.copynumber.max` to a proper value (the best is consistent with [read_copynumber](#)).

Value

a list contains a matrix used for NMF de-composition.

Methods (by class)

- CopyNumber: Returns copy number features, components and component-by-sample matrix
- MAF: Returns SBS mutation sample-by-component matrix and APOBEC enrichment

}

```

simulation

Simulation Analysis

Description

- `simulate_signature()` - Simulate signatures from signature pool.
- `simulate_catalogue()` - Simulate catalogs from signature/catalog pool.

Usage

```
simulate_signature(x, weights = NULL)
```

```
simulate_catalogue(x, n, weights = NULL)
```

Arguments

x	a numeric vector representing a signature/catalog or matrix with rows representing signatures/samples and columns representing components.
weights	a numeric vector for weights.
n	an integer indicating mutation number to be generated in a catalog.

Value

a matrix.

Examples

```
# Generate a catalog
set.seed(1234)
catalog <- as.integer(table(sample(1:96, 1000, replace = TRUE)))
names(catalog) <- paste0("comp", 1:96)
# Generate a signature
sig <- catalog / sum(catalog)

# Simulate catalogs
x1 <- simulate_catalogue(catalog, 10) # 10 mutations
x1
x2 <- simulate_catalogue(catalog, 100) # 100 mutations
x2
x3 <- simulate_catalogue(catalog, 1000) # 1000 mutations
x3
# Similar with a signature
x4 <- simulate_catalogue(sig, 10) # 10 mutations
x4

# Load SBS signature
load(system.file("extdata", "toy_mutational_signature.RData",
  package = "sigminer", mustWork = TRUE
))
s <- t(sig2$Signature.norm)
# Generate a signature from multiple signatures/catalogs
s1 <- simulate_signature(s)
s1
s2 <- simulate_signature(s, weights = 1:3)
s2
# Generate a catalog from multiple signatures/catalogs
c1 <- simulate_catalogue(s, 100, weights = 1:3)
c1
```

Description

Subset data slot of [CopyNumber](#) object, un-selected rows will move to dropoff.segs slot, annotation slot will update in the same way.

Usage

```
## S3 method for class 'CopyNumber'  
subset(x, subset = TRUE, ...)
```

Arguments

x a [CopyNumber](#) object to be subsetted.
subset logical expression indicating rows to keep.
... further arguments to be passed to or from other methods. Useless here.

Value

a [CopyNumber](#) object

```

transcript.hg38	<i>Merged Transcript Location at Genome Build hg38</i>
-----------------	--

Description

Merged Transcript Location at Genome Build hg38

Format

A data.table

Source

from GENCODE release v33.

Examples

```
data(transcript.hg38)
```

transcript.mm10	<i>Merged Transcript Location at Genome Build mm10</i>
-----------------	--

Description

Merged Transcript Location at Genome Build mm10

Format

A data.table

Source

from GENCODE release M25 ftp://ftp.ebi.ac.uk/pub/databases/gencode/Gencode_mouse/release_M25/gencode.vM25.annotation.gtf.gz

Examples

```
data(transcript.mm10)
```

transform_seg_table *Transform Copy Number Table*

Description

Transform Copy Number Table

Usage

```
transform_seg_table(
  data,
  genome_build = c("hg19", "hg38", "mm10"),
  ref_type = c("cytoband", "gene"),
  values_fill = NA,
  values_fn = function(x, ...) { round(mean(x, ...)) },
  resolution_factor = 1L
)
```

Arguments

data	a CopyNumber object or a data.frame containing at least 'chromosome', 'start', 'end', 'segVal', 'sample' these columns.
genome_build	genome build version, used when data is a data.frame, should be 'hg19' or 'hg38'.
ref_type	annotation data type used for constructing matrix.
values_fill	Optionally, a (scalar) value that specifies what each value should be filled in with when missing. This can be a named list if you want to apply different aggregations to different value columns.
values_fn	Optionally, a function applied to the value in each cell in the output. You will typically use this when the combination of id_cols and value column does not uniquely identify an observation. This can be a named list if you want to apply different aggregations to different value columns.
resolution_factor	an integer to control the resolution. When it is 1 (default), compute frequency in each cytoband. When it is 2, use compute frequency in each half cytoband.

Value

a data.table.

Examples

```
load(system.file("extdata", "toy_copynumber.RData",
  package = "sigminer", mustWork = TRUE
))
# Compute the mean segVal in each cytoband
x <- transform_seg_table(cn, resolution_factor = 1)
x
# Compute the mean segVal in each half-cytoband
x2 <- transform_seg_table(cn, resolution_factor = 2)
x2
```

use_color_style	<i>Set Color Style for Plotting</i>
-----------------	-------------------------------------

Description

Set Color Style for Plotting

Usage

```
use_color_style(
  style,
  mode = c("SBS", "copynumber", "DBS", "ID", "RS"),
  method = "Wang"
)
```

Arguments

style	one of 'default' and 'cosmic'.
mode	only used when the style is 'cosmic', can be one of "SBS", "copynumber", "DBS", "ID".
method	used to set a more custom palette for different methods.

Value

color values.

Examples

```
use_color_style("default")
use_color_style("cosmic")
```
